# Guarantee

---

This equipment is guaranteed against defects in materials and workmanship. We will repair or replace products which prove to be defective during the guarantee period as detailed on your invoice, provided they are returned to us prepaid. The guarantee will not apply to:

- Equipment which has been modified or altered in any way without the written permission of Campbell Scientific
- Batteries
- Any product which has been subjected to misuse, neglect, acts of God or damage in transit.

Campbell Scientific will return guaranteed equipment by surface carrier prepaid. Campbell Scientific will not reimburse the claimant for costs incurred in removing and/or reinstalling equipment. This guarantee and the Company's obligation thereunder is in lieu of all other guarantees, expressed or implied, including those of suitability and fitness for a particular purpose. Campbell Scientific is not liable for consequential damage.

Please inform us before returning equipment and obtain a Repair Reference Number whether the repair is under guarantee or not. Please state the faults as clearly as possible, and if the product is out of the guarantee period it should be accompanied by a purchase order. Quotations for repairs can be given on request. It is the policy of Campbell Scientific to protect the health of its employees and provide a safe working environment, in support of this policy a "Declaration of Hazardous Material and Decontamination" form will be issued for completion.

When returning equipment, the Repair Reference Number must be clearly marked on the outside of the package. Complete the "Declaration of Hazardous Material and Decontamination" form and ensure a completed copy is returned with your goods. Please note your Repair may not be processed if you do not include a copy of this form and Campbell Scientific Ltd reserves the right to return goods at the customers' expense.

Note that goods sent air freight are subject to Customs clearance fees which Campbell Scientific will charge to customers. In many cases, these charges are greater than the cost of the repair.

# PLEASE READ FIRST

---

## About this manual

Please note that this manual was originally produced by Campbell Scientific Inc. primarily for the North American market. Some spellings, weights and measures may reflect this origin.

Some useful conversion factors:

**Area:** 1 in<sup>2</sup> (square inch) = 645 mm<sup>2</sup>

**Length:** 1 in. (inch) = 25.4 mm  
1 ft (foot) = 304.8 mm  
1 yard = 0.914 m  
1 mile = 1.609 km

**Mass:** 1 oz. (ounce) = 28.35 g  
1 lb (pound weight) = 0.454 kg

**Pressure:** 1 psi (lb/in<sup>2</sup>) = 68.95 mb

**Volume:** 1 UK pint = 568.3 ml  
1 UK gallon = 4.546 litres  
1 US gallon = 3.785 litres

In addition, while most of the information in the manual is correct for all countries, certain information is specific to the North American market and so may not be applicable to European users.

Differences include the U.S standard external power supply details where some information (for example the AC transformer input voltage) will not be applicable for British/European use. *Please note, however, that when a power supply adapter is ordered it will be suitable for use in your country.*

Reference to some radio transmitters, digital cell phones and aerials may also not be applicable according to your locality.

Some brackets, shields and enclosure options, including wiring, are not sold as standard items in the European market; in some cases alternatives are offered. Details of the alternatives will be covered in separate manuals.

Part numbers prefixed with a “#” symbol are special order parts for use with non-EU variants or for special installations. Please quote the full part number with the # when ordering.

## Recycling information

At the end of this product's life it should not be put in commercial or domestic refuse but sent for recycling. Any batteries contained within the product or used during the products life should be removed from the product and also be sent to an appropriate recycling facility.

Campbell Scientific Ltd can advise on the recycling of the equipment and in some cases arrange collection and the correct disposal of it, although charges may apply for some items or territories.

For further advice or support, please contact Campbell Scientific Ltd, or your local agent.

# Precautions

---

DANGER — MANY HAZARDS ARE ASSOCIATED WITH INSTALLING, USING, MAINTAINING, AND WORKING ON OR AROUND **TRIPODS, TOWERS, AND ANY ATTACHMENTS TO TRIPODS AND TOWERS SUCH AS SENSORS, CROSSARMS, ENCLOSURES, ANTENNAS, ETC.** FAILURE TO PROPERLY AND COMPLETELY ASSEMBLE, INSTALL, OPERATE, USE, AND MAINTAIN TRIPODS, TOWERS, AND ATTACHMENTS, AND FAILURE TO HEED WARNINGS, INCREASES THE RISK OF DEATH, ACCIDENT, SERIOUS INJURY, PROPERTY DAMAGE, AND PRODUCT FAILURE. TAKE ALL REASONABLE PRECAUTIONS TO AVOID THESE HAZARDS. CHECK WITH YOUR ORGANIZATION'S SAFETY COORDINATOR (OR POLICY) FOR PROCEDURES AND REQUIRED PROTECTIVE EQUIPMENT PRIOR TO PERFORMING ANY WORK.

Use tripods, towers, and attachments to tripods and towers only for purposes for which they are designed. Do not exceed design limits. Be familiar and comply with all instructions provided in product manuals. Manuals are available at [www.campbellsci.eu](http://www.campbellsci.eu) or by telephoning +44(0) 1509 828 888 (UK). You are responsible for conformance with governing codes and regulations, including safety regulations, and the integrity and location of structures or land to which towers, tripods, and any attachments are attached. Installation sites should be evaluated and approved by a qualified engineer. If questions or concerns arise regarding installation, use, or maintenance of tripods, towers, attachments, or electrical connections, consult with a licensed and qualified engineer or electrician.

## General

- Prior to performing site or installation work, obtain required approvals and permits. Comply with all governing structure-height regulations, such as those of the FAA in the USA.
- Use only qualified personnel for installation, use, and maintenance of tripods and towers, and any attachments to tripods and towers. The use of licensed and qualified contractors is highly recommended.
- Read all applicable instructions carefully and understand procedures thoroughly before beginning work.
- Wear a **hardhat** and **eye protection**, and take **other appropriate safety precautions** while working on or around tripods and towers.
- **Do not climb** tripods or towers at any time, and prohibit climbing by other persons. Take reasonable precautions to secure tripod and tower sites from trespassers.
- Use only manufacturer recommended parts, materials, and tools.

## Utility and Electrical

- **You can be killed** or sustain serious bodily injury if the tripod, tower, or attachments you are installing, constructing, using, or maintaining, or a tool, stake, or anchor, come in **contact with overhead or underground utility lines**.
- Maintain a distance of at least one-and-one-half times structure height, or 20 feet, or the distance required by applicable law, **whichever is greater**, between overhead utility lines and the structure (tripod, tower, attachments, or tools).
- Prior to performing site or installation work, inform all utility companies and have all underground utilities marked.
- Comply with all electrical codes. Electrical equipment and related grounding devices should be installed by a licensed and qualified electrician.

## Elevated Work and Weather

- Exercise extreme caution when performing elevated work.
- Use appropriate equipment and safety practices.
- During installation and maintenance, keep tower and tripod sites clear of un-trained or non-essential personnel. Take precautions to prevent elevated tools and objects from dropping.
- Do not perform any work in inclement weather, including wind, rain, snow, lightning, etc.

## Maintenance

- Periodically (at least yearly) check for wear and damage, including corrosion, stress cracks, frayed cables, loose cable clamps, cable tightness, etc. and take necessary corrective actions.
- Periodically (at least yearly) check electrical ground connections.

WHILE EVERY ATTEMPT IS MADE TO EMBODY THE HIGHEST DEGREE OF SAFETY IN ALL CAMPBELL SCIENTIFIC PRODUCTS, THE CUSTOMER ASSUMES ALL RISK FROM ANY INJURY RESULTING FROM IMPROPER INSTALLATION, USE, OR MAINTENANCE OF TRIPODS, TOWERS, OR ATTACHMENTS TO TRIPODS AND TOWERS SUCH AS SENSORS, CROSSARMS, ENCLOSURES, ANTENNAS, ETC.

# ***HMP60 Temperature and Relative Humidity Probe***

---

## **1. Introduction**

The HMP60 probe measures temperature for the range of –40 to 60 °C, and relative humidity for the range of 0 to 100% RH. It is suitable for long-term, unattended monitoring, and is compatible with all Campbell Scientific dataloggers.

For Edlog datalogger support, check the availability of an older manual at [www.campbellsci.com/old-manuals](http://www.campbellsci.com/old-manuals).

## **2. Precautions**

- READ AND UNDERSTAND the *Safety* section at the front of this manual.
- When opening the shipping package, do not damage or cut the cable jacket. If damage to the cable is suspected, contact Campbell Scientific.
- Although rugged, the HMP60 should be handled as a precision scientific instrument.
- Remove the yellow cap prior to installation.
- Santoprene® rubber, which composes the black outer jacket of the 107 cable, will support combustion in air. It is used because of its resistance to temperature extremes, moisture, and UV degradation. It is rated as slow burning when tested according to U.L. 94 H.B. and passes FMVSS302. However, local fire codes may preclude its use inside buildings.

## **3. Initial Inspection**

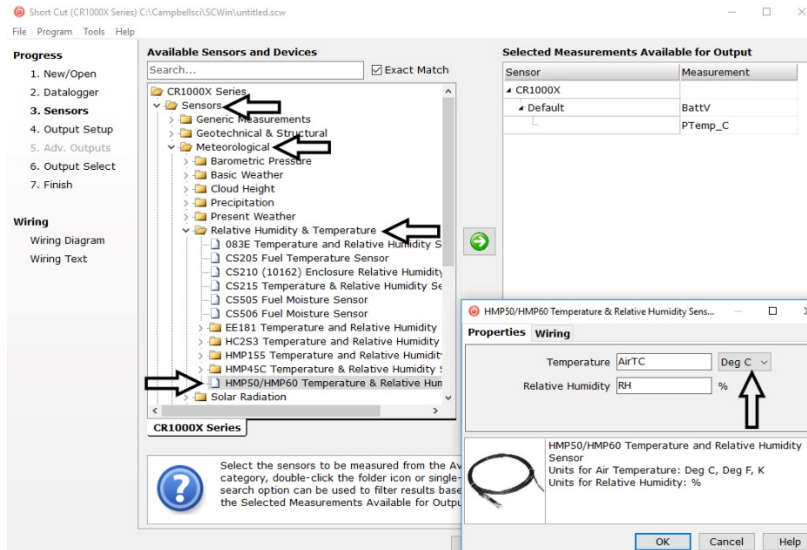

- Check the packaging and contents of the shipment. If damage occurred during transport, immediately file a claim with the carrier. Contact Campbell Scientific to facilitate repair or replacement.
- Check model information against the shipping documents to ensure the expected products and the correct lengths of cable are received. Model numbers are found on each product. On cables and cabled items, the model number is usually found at the connection end of the cable. Report any shortages immediately to Campbell Scientific.

## **4. QuickStart**

*Short Cut* is an easy way to program your datalogger to measure the HMP60 sensor and assign datalogger wiring terminals. *Short Cut* is available as a download on [www.campbellsci.eu](http://www.campbellsci.eu) and the *ResourceDVD*. It is included in installations of *LoggerNet*, *PC200W*, *PC400*, or *RTDAQ*.

Use the following procedure to get started.

1. Open *Short Cut* and create a new program.
2. Double-click the datalogger model.
3. Under the **Available Sensors and Devices** list, select **Sensors | Meteorological | Relative Humidity & Temperature** and double-click **HMP50/HMP60 Temperature & Relative Humidity Sensor**. Data defaults to degree Celsius. This can be changed by clicking the **Deg C** box and selecting **Deg F**, for degrees Fahrenheit, or **K** for Kelvin.

4. After selecting the sensor, click **Wiring Diagram** to see how the sensor is to be wired to the datalogger. The wiring diagram can be printed now or after more sensors are added.

5. Select any other sensors you have, and then finish the remaining *Short Cut* steps to complete the program. The remaining steps are outlined in *Short Cut Help*, which is accessed by clicking on **Help | Contents | Programming Steps**.
6. If *LoggerNet*, *PC400*, *RTDAQ*, or *PC200W* is running on your PC, and the PC to datalogger connection is active, you can click **Finish** in *Short Cut* and you will be prompted to send the program just created to the datalogger.
7. If the sensor is connected to the datalogger, as shown in the wiring diagram in step 4, check the output of the sensor in the datalogger support software data display to make sure it is making reasonable measurements.

## 5. Overview

The HMP60 Temperature and Relative Humidity probe contains a Platinum Resistance Temperature detector (PRT) and a Vaisala INTERCAP® capacitive relative humidity sensor. It is suitable for long-term, unattended monitoring. The humidity chip is field-replaceable, eliminating recalibration downtime.

## 6. Specifications

### Features:

- Field-replaceable humidity chip eliminates recalibration down time
- Compatible with the CWS900-series interfaces, allowing it to be used in a wireless sensor network
- Compatible with the following dataloggers: CR200(X) series, CR300 series, CR6 series, CR800 series, CR1000X, CR1000, CR3000, CR5000, CR9000(X)

<b>Operating Temperature:</b>	–40 to 60 °C
<b>Probe Length:</b>	7.1 cm (2.8 in)
<b>Probe Body Diameter:</b>	1.2 cm (0.47 in)
<b>Filter:</b>	0.2 µm Teflon membrane
<b>Filter Diameter:</b>	1.2 cm (0.47 in)
<b>Housing</b>	
<b>Body Material:</b>	AISI 316 stainless steel
<b>Filter Cap Material:</b>	Chrome-coated ABS plastic
<b>Classification:</b>	IP65
<b>Power Consumption:</b>	1 mA typical; 5 mA maximum
<b>Supply Voltage:</b>	5 to 28 Vdc
<b>Settling Time after power is switched on:</b>	1 s
<b>Output Signal Range:</b>	0 to 1 Vdc

## 6.1 Temperature Sensor

<b>Sensor:</b>	1000 $\Omega$ PRT, DIN 43760B
<b>Temperature Measurement Range:</b>	–40 to 60 °C
<b>Temperature Accuracy:</b>	$\pm 0.6$ °C (–40 to 60 °C)

## 6.2 Relative Humidity Sensor

<b>Sensor:</b>	INTERCAP®
<b>Relative Humidity Measurement Range:</b>	0 to 100% non-condensing
<b>Typical Accuracy from 0 to 40 °C:</b>	$\pm 3\%$ RH over 0 to 90% $\pm 5\%$ RH over 90 to 100%
<b>Typical Accuracy from –40 to 0 °C and 40 to 60 °C:</b>	$\pm 5\%$ RH over 0 to 90% $\pm 7\%$ RH over 90 to 100%

# 7. Installation

If you are programming your datalogger with *Short Cut*, skip Section [7.1](#), *Wiring to Datalogger* (p. 4), and Section [7.2](#), *Datalogger Programming* (p. 5). *Short Cut* does this work for you. See Section [4](#), *QuickStart* (p. 1), for a *Short Cut* tutorial.

## 7.1 Wiring to Datalogger

---

**CAUTION**

Always connect the blue wire to the datalogger first, followed by the black, white, and clear wires. Connect the brown (power) wire last.

---

**TABLE 7-1. Wire Colour, Function, and Datalogger Connection**

Wire Colour	Wire Function	Datalogger Connection Terminal
Black	Temperature signal	U configured for single-ended analogue input <sup>1</sup> , SE (single-ended, analogue-voltage input)
White	Relative humidity signal	U configured for single-ended analogue input, SE
Blue	Power ground and signal reference	G
Brown	Power	12V
Clear	EMF Shield	⏏ (analogue ground)
<sup>1</sup> U channels are automatically configured by the measurement instruction.		

## 7.2 Datalogger Programming

*Short Cut* is the best source for up-to-date datalogger programming code. Programming code is needed when:

- Creating a program for a new datalogger installation
- Adding sensors to an existing datalogger program

If your data acquisition requirements are simple, you can probably create and maintain a datalogger program exclusively with *Short Cut*. If your data acquisition needs are more complex, the files that *Short Cut* creates are a great source for programming code to start a new program or add to an existing custom program.

### NOTE

*Short Cut* cannot edit programs after they are imported and edited in *CRBasic Editor*.

A *Short Cut* tutorial is available in Section 4, *QuickStart* (p. 1). If you wish to import *Short Cut* code into *CRBasic Editor* to create or add to a customized program, follow the procedure in Appendix A, *Importing Short Cut Code to CRBasic Editor* (p. A-1). Programming basics for CRBasic dataloggers are provided in the following sections. Complete program examples for select dataloggers can be found in Appendix B, *Example Program* (p. B-1).

### 7.2.1 VoltSE() Instruction

Use the **VoltSE()** CRBasic instruction to measure the HMP60's signal.

The probe output scale is 0 to 1000 millivolts for the temperature range of –40 to 60 °C and for the relative humidity range of 0 to 100%.

**VoltSE**(Dest, Reps, Range, SEChan, MeasOff, SettlingTime, Integ/FNotch, Mult, Offset)

Variations:

- Temperature reported as °C — set **Mult** to **0.1** and **Offset** to **–40**
- Temperature reported as °F — set **Mult** to **.18** and **Offset** to **–40**
- Humidity reported as a percent — set **Mult** to **0.1** and **Offset** to **0**
- Humidity reported as a fraction — set **Mult** to **0.001** and **Offset** to **0**

## 7.3 Installation

Locate the sensor over an open, level area at least 9 m (EPA) in diameter. The surface should be covered by short grass or the natural earth surface where grass does not grow. Sensors should be located at a distance of at least four times the height of any nearby obstruction and at least 30 m (EPA) from large, paved areas. Sensors should be protected from thermal radiation and adequately ventilated.

Standard measurement heights:

1.5 m (AASC)  
1.25 – 2.0 m (WMO)  
2.0 m (EPA)

See Section 10, *Attributions and References* (p. 11), for a list of references that discuss temperature and relative humidity sensors.

When used in the field, the HMP60 must be housed inside a solar radiation shield. Typically, the 41303-5A or RAD06 six-plate solar radiation shield is used. The HMP60 is held within the 41303-5A by a mounting clamp (FIGURE 7-2).

This probe may also be housed in a 41003-5 or RAD10 ten-plate shield. Additional hardware must be used with the 41003-5. No additional hardware is required with the RAD10. A 41322 Adapter Plate allows the HMP60 to be mounted in the lower part of the 41003-5 shield.

The white colour of these shields reflects solar radiation, and the louvered construction allows air to pass freely through, thereby keeping the probe at or near ambient temperature. The RAD06 and RAD10 use a double-louvered design that offers improved sensor protection from insect intrusion and driving rain and snow. In addition, the RAD06 and RAD10 shields have lower self-heating in bright sunlight combined with higher temperatures (> 24 °C (75 °F)) and low wind speeds (< 2 m/s (4.5 mph)), giving a better measurement.

Each of these solar radiation shields attaches to a crossarm, mast, or user-supplied pipe with a 2.5 to 5.3 cm (1.0 to 2.1 in) outer diameter.

Tools required for installing a radiation shield to a tripod or tower include:

- 1/2-inch open-end wrench
- small screwdriver provided with datalogger
- small Phillips screwdriver
- UV-resistant cable ties
- small pair of diagonal-cutting pliers
- adjustable wrench with a minimum 1-7/8 inch jaw size

FIGURE 7-1. HMP60 as shipped

### 7.3.1 Installation in a 41303-5A or 41303-5B 6-Plate Shield

1. Pull off the yellow shipping cap (see FIGURE 7-1).
2. With a small Phillips screwdriver, loosen the plastic split collar at the base of the shield (reversing the removable portion if necessary) and gently insert the probe.
3. Tighten the screws on the collar until it firmly grips the probe body (see FIGURE 7-2).

FIGURE 7-2. HMP60 and 41303-5A Radiation Shield

### 7.3.2 Installation in a RAD06 6-Plate Shield or RAD10 10-Plate Shield

1. Pull off the yellow shipping cap (see FIGURE 7-1).
2. Loosen the nut on the entry gland at the bottom of the shield.
3. Insert the sensor up into the gland as far as it will go. (See FIGURE 7-4.)
4. Using an adjustable wrench, tighten the nut on the gland until the sensor is held firmly in place. Do not overtighten.

### 7.3.3 Mount the Shield

1. Attach the radiation shield to the tripod mast, crossarm, or tower leg using the supplied U-bolt. See FIGURE 7-3 and FIGURE 7-4 for examples of shield mounting.

2. Route the cable to the datalogger, and secure the cable to the mounting structure using cable ties.

**CAUTION**

Failure to secure the cable can lead to breakage of the wires due to fatigue caused by blowing back and forth in the wind.

*FIGURE 7-3. HMP60 and 41303-5A Radiation Shield on a tripod mast (left) and on a CM202 Crossarm (right)*

*FIGURE 7-4. HMP60 and RAD06 Radiation Shield on a tripod mast*

## 8. Operation

### 8.1 Measurement

The HMP60 Temperature and Relative Humidity Probe uses a Platinum Resistance Temperature detector (PRT) and a Vaisala INTERCAP<sup>®</sup> capacitive relative humidity sensor.

## 8.2 Long Lead Lengths

Long lead lengths cause errors in the measured temperature and relative humidity. The approximate error in temperature and relative humidity is 0.52 °C and 0.52% per 100 feet of cable length, respectively.

When long lead lengths are required and the above errors in temperature and relative humidity are unacceptable, use the EE181 or HMP155A temperature and humidity probe.

Understanding the following details are not required for the general operation of the HMP60 with Campbell Scientific's dataloggers. The signal reference and the power ground (black) are the same lead in the HMP60. When the HMP60 temperature and relative humidity are measured, both the signal reference and power ground are connected to ground at the datalogger. The signal reference/power ground lead serves as the return path for 12 V. There will be a voltage drop along this lead because the wire itself has resistance. The HMP60 draws approximately 2 mA when it is powered. The wire used in the HMP60 (pn #18159) has resistance of 26.2 Ω/1000 feet. Using Ohm's law, the voltage drop ( $V_d$ ), along the signal reference/power ground lead, is given by Eq. (1).

$$\begin{aligned} V_d &= I \times R \\ &= 2 \text{ mA} \times 26.2 \Omega / 1000 \text{ ft} \\ &= 52.4 \text{ mV} / 1000 \text{ ft} \end{aligned} \quad (1)$$

This voltage drop will raise the apparent temperature and relative humidity because the difference between the signal and signal reference at the datalogger has increased by  $V_d$ .

## 9. Troubleshooting and Maintenance

### NOTE

All factory repairs and recalibrations require a returned material authorization (RMA) and completion of the "Declaration of Hazardous Material and Decontamination" form. Refer to the [Assistance](#) page at the beginning of this manual for more information.

### 9.1 Troubleshooting

Symptom: Relative Humidity is reported as **NAN**, **-9999**, or **0%**

1. Check that the sensor is wired to the correct analogue input channels as specified by the measurement instructions.
2. Verify the voltage range code for the single-ended measurement instruction is correct for the datalogger type.

Symptom: Incorrect temperature or relative humidity

1. Verify the multiplier and offset parameters are correct for the desired units (see Section 7.2.1, *VoltSE() Instruction* (p. 5)).

## 9.2 Maintenance

Check the radiation shield monthly to make sure it is free from dust and debris. To clean the shield, first remove the sensor. Dismount the shield. Brush all loose dirt off. If more effort is needed, use warm, soapy water and a soft cloth or brush to thoroughly clean the shield. Allow the shield to dry before remounting.

The white screen at the tip of the HMP60 should also be checked for contaminants.

When installed in close proximity to the ocean or other bodies of salt water (e.g., Great Salt Lake), a coating of salt (mostly NaCl) may build up on the radiation shield, sensor, filter and even the chip. NaCl has an affinity for water. The humidity over a saturated NaCl solution is 75%. A buildup of salt on the filter or chip will delay or destroy the response to atmospheric humidity.

The filter can be rinsed gently in distilled water. If necessary, the chip can be removed and rinsed as well (see FIGURE 9-1 and Section 9.2.1, *Procedure for Removing RH Chip* (p. 10)). Do not scratch the silver chip while cleaning. It might be necessary to repeat rinsing.

FIGURE 9-1. Exploded view of HMP60 (as shipped)

The offset and gain on the HMP60 electronics cannot be adjusted as part of a recalibration. Generally, the RH chip should be replaced every two years. To determine if the chip needs to be replaced, compare the RH reading with a reference, and replace the RH chip when the relative humidity measurement is out of tolerance.

### 9.2.1 Procedure for Removing RH Chip

1. Unscrew the protective cap.
2. Hold the plastic sides of the RH chip and unplug it.

**CAUTION**

---

To prevent scratching, avoid touching the silver RH chip, and handle the RH chip with care.

---

3. Rinse the RH chip or dispose of the old RH chip.
4. Hold the sides of the rinsed or new chip and plug it in.
5. Screw on the protective cap.

# Appendix A. Importing Short Cut Code to CRBasic Editor

---

This tutorial shows:

- How to import a *Short Cut* program into a program editor for additional refinement
- How to import a wiring diagram from *Short Cut* into the comments of a custom program

*Short Cut* creates files, which can be imported into *CRBasic Editor*. Assuming defaults were used when *Short Cut* was installed, these files reside in the C:\campbellsci\SCWin folder:

- .DEF (wiring and memory usage information)
- .CR2 (CR200(X)-series datalogger code)
- .CR300 (CR300-series datalogger code)
- .CR6 (CR6-series datalogger code)
- .CR8 (CR800-series datalogger code)
- .CR1X (CR1000X datalogger code)
- .CR1 (CR1000 datalogger code)
- .CR3 (CR3000 datalogger code)
- .CR5 (CR5000 datalogger code)

Use the following procedure to import *Short Cut* code and wiring diagram into *CRBasic Editor*.

1. Create the *Short Cut* program following the procedure in Section 4, *QuickStart* (p. 1). Finish the program and exit *Short Cut*. Make note of the file name used when saving the *Short Cut* program.
2. Open *CRBasic Editor*.
3. Click **File | Open**. Assuming the default paths were used when *Short Cut* was installed, navigate to C:\CampbellSci\SCWin folder. The file of interest has the .CR2, .CR300, .CR6, .CR8, .CR1X, .CR1, .CR3, or .CR5 extension. Select the file and click **Open**.
4. Immediately save the file in a folder different from C:\Campbellsci\SCWin, or save the file with a different file name.

---

## NOTE

Once the file is edited with *CRBasic Editor*, *Short Cut* can no longer be used to edit the datalogger program. Change the name of the program file or move it, or *Short Cut* may overwrite it next time it is used.

---

5. The program can now be edited, saved, and sent to the datalogger.
6. Import wiring information to the program by opening the associated .DEF file. Copy and paste the section beginning with heading “–Wiring for CRXXX–” into the *CRBasic* program, usually at the head of the file. After pasting, edit the information such that an apostrophe (') begins each line. This character instructs the datalogger compiler to ignore the line when compiling.

# Appendix B. Example Program

This example can be used directly with CR800-series and CR1000 dataloggers and can be modified for use with CR300- and CR6-series, CR3000, and CR5000 dataloggers.

## CRBasic Example B-1. Temperature and RH Program

```
'Program measures the HMP60 probe once every 5 seconds and stores the average
'temperature and a sample of the relative humidity every 60 minutes.

'Wiring Diagram
'=====
'HMP60
'Wire      CR1000
'Colour    Function                               Terminal

DataTable(Temp_RH,True,-1)
  DataInterval(0,60,Min,0)
  Average(1,AirTC,FP2,False)
  Sample(1,RH,FP2)
EndTable

BeginProg
  Scan(5,Sec,1,0)
  PortSet(9,1)      'Turn on switched 12V
  Delay(0,3,Sec)     '3-second delay
  'HMP50/HMP60 Temperature & Relative Humidity Sensor measurements AirTC and RH
  VoltSe(AirTC,1,mV2500,1,0,0,_60Hz,0.1,-40)
  VoltSE(RH,1,mV2500,2,0,0,_60Hz,0.1,0)
  If RH>100 AND RH<108 Then RH=100
  CallTable(Temp_RH)
  NextScan
EndProg
```

# Appendix C. Absolute Humidity

---

The HMP60 measures the relative humidity. Relative humidity is defined by the equation below:

$$RH = \frac{e}{e_s} \times 100 \quad (C-1)$$

where RH is the relative humidity,  $e$  is the vapour pressure in kPa, and  $e_s$  is the saturation vapour pressure in kPa. The vapour pressure,  $e$ , is an absolute measure of the amount of water vapour in the air and is related to the dew point temperature. The saturation vapour pressure is the maximum amount of water vapour that air can hold at a given air temperature. The relationship between dew point and vapour pressure, and air temperature and saturation vapour pressure are given by Goff and Gratch (1946), Lowe (1977), and Weiss (1977).

When the air temperature increases, so does the saturation vapour pressure. Conversely, a decrease in air temperature causes a corresponding decrease in saturation vapour pressure. It follows then from Eq. (C-1) that a change in air temperature will change the relative humidity, without causing a change in absolute humidity.

For example, for an air temperature of 20 °C and a vapour pressure of 1.17 kPa, the saturation vapour pressure is 2.34 kPa and the relative humidity is 50%. If the air temperature is increased by 5 °C and no moisture is added or removed from the air, the saturation vapour pressure increases to 3.17 kPa and the relative humidity decreases to 36.9%. After the increase in air temperature, there is more energy available to vapourize the water. However, the actual amount of water vapour in the air has not changed. Thus, the amount of water vapour in the air, relative to saturation, has decreased.

Because of the inverse relationship between relative humidity and air temperature, finding the mean relative humidity is meaningless. A more useful quantity is the mean vapour pressure. The mean vapour pressure can be computed on-line by the datalogger. CRBasic dataloggers use the **VapourPressure()** instruction to calculate vapour pressure from temperature and relative humidity measurements (see Appendix C.1, *CR1000 Vapour Pressure Example (p. C-1)*).

## C.1 CR1000 Vapour Pressure Example

The **VapourPressure()** instruction has the following syntax:

**VapourPressure**(Dest, Temp, RH)

Where:

Dest is the variable in which the results of the instruction will be stored.

Temp is the program variable that contains the value for the temperature sensor. The temperature measurement must be in degrees Celsius.

RH is the program variable that contains the value for the relative humidity sensor. The relative humidity measurement must be in percent of RH.

CRBasic Example C-1. Vapour Pressure Program

```
'Wiring Diagram
'=====
'HMP60
'Wire      CR1000
'Colour    Function                      Terminal
'-----
'Black     Temperature signal           SE1
'White     Relative Humidity signal     SE2
'Brown     Power                       12V
'Blue      Signal & Power Reference     G
'Clear     Shield                      Ground Symbol

Public AirTC
Public RH
Public VP

DataTable(Table1,True,-1)
  DataInterval(0,60,Min,0)
  Average(1,AirTC,FP2,0)
  Sample(1,RH,FP2)
  Average(1,VP, FP2,0)
EndTable

BeginProg
  Scan(5,Sec,1,0)
    'HMP60 Temperature & Relative Humidity Sensor measurements AirTC and RH:
    VoltSE(AirTC,1,mV2500,1,0,0,_60Hz,0.1,-40.0)
    VoltSE(RH,1,mV2500,2,0,0,_60Hz,0.1,0)
    If (RH>100) AND (RH<108) Then RH=100
    VaporPressure(VP,AirTC,RH)
    CallTable(Table1)
  NextScan
EndProg
```
