WARRANTY AND ASSISTANCE

This equipment is warranted by CAMPBELL SCIENTIFIC (CANADA) CORP. ("CSC") to be free from defects in materials and workmanship under normal use and service for twelve (12) months from date of shipment unless specified otherwise. ***** Batteries are not warranted. ***** CSC's obligation under this warranty is limited to repairing or replacing (at CSC's option) defective products. The customer shall assume all costs of removing, reinstalling, and shipping defective products to CSC. CSC will return such products by surface carrier prepaid. This warranty shall not apply to any CSC products which have been subjected to modification, misuse, neglect, accidents of nature, or shipping damage. This warranty is in lieu of all other warranties, expressed or implied, including warranties of merchantability or fitness for a particular purpose. CSC is not liable for special, indirect, incidental, or consequential damages.

Products may not be returned without prior authorization. To obtain a Return Merchandise Authorization (RMA), contact CAMPBELL SCIENTIFIC (CANADA) CORP., at (780) 454-2505. An RMA number will be issued in order to facilitate Repair Personnel in identifying an instrument upon arrival. Please write this number clearly on the outside of the shipping container. Include description of symptoms and all pertinent details.

CAMPBELL SCIENTIFIC (CANADA) CORP. does not accept collect calls.

Non-warranty products returned for repair should be accompanied by a purchase order to cover repair costs.
Assistance

Products may not be returned without prior authorization. The following contact information is for Canadian and international clients residing in countries served by Campbell Scientific (Canada) Corp. directly. Affiliate companies handle repairs for clients within their territories. Please visit www.campbellsci.ca to determine which Campbell Scientific company serves your country.

To obtain a Returned Materials Authorization (RMA), contact CAMPBELL SCIENTIFIC (CANADA) CORP., phone (780) 454-2505. After a measurement consultant determines the nature of the problem, an RMA number will be issued. Please write this number clearly on the outside of the shipping container. Campbell Scientific’s shipping address is:

CAMPBELL SCIENTIFIC (CANADA) CORP.
RMA#_____
14532 131 Avenue NW
Edmonton, Alberta  T5L 4X4
Canada

For all returns, the client must fill out a “Statement of Product Cleanliness and Decontamination” form and comply with the requirements specified in it. The form is available from our web site at www.campbellsci.ca/repair. A completed form must be either emailed to repair@campbellsci.ca or faxed to (780) 454-2655. Campbell Scientific (Canada) Corp. is unable to process any returns until we receive this form. If the form is not received within three days of product receipt or is incomplete, the product will be returned to the client at the client’s expense. Campbell Scientific (Canada) Corp. reserves the right to refuse service on products that were exposed to contaminants that may cause health or safety concerns for our employees.
Precautions

DANGER — MANY HAZARDS ARE ASSOCIATED WITH INSTALLING, USING, MAINTAINING, AND WORKING ON OR AROUND TRIPODS, TOWERS, AND ANY ATTACHMENTS TO TRIPODS AND TOWERS SUCH AS SENSORS, CROSSARMS, ENCLOSURES, ANTENNAS, ETC. FAILURE TO PROPERLY AND COMPLETELY ASSEMBLE, INSTALL, OPERATE, USE, AND MAINTAIN TRIPODS, TOWERS, AND ATTACHMENTS, AND FAILURE TO HEED WARNINGS, INCREASES THE RISK OF DEATH, ACCIDENT, SERIOUS INJURY, PROPERTY DAMAGE, AND PRODUCT FAILURE. TAKE ALL REASONABLE PRECAUTIONS TO AVOID THESE HAZARDS. CHECK WITH YOUR ORGANIZATION’S SAFETY COORDINATOR (OR POLICY) FOR PROCEDURES AND REQUIRED PROTECTIVE EQUIPMENT PRIOR TO PERFORMING ANY WORK.

Use tripods, towers, and attachments to tripods and towers only for purposes for which they are designed. Do not exceed design limits. Be familiar and comply with all instructions provided in product manuals. Manuals are available at www.campbellsci.ca or by telephoning (780) 454-2505 (Canada). You are responsible for conformance with governing codes and regulations, including safety regulations, and the integrity and location of structures or land to which towers, tripods, and any attachments are attached. Installation sites should be evaluated and approved by a qualified personnel (e.g. engineer). If questions or concerns arise regarding installation, use, or maintenance of tripods, towers, attachments, or electrical connections, consult with a licensed and qualified engineer orelectrician.

General
- Prior to performing site or installation work, obtain required approvals and permits.
- Use only qualified personnel for installation, use, and maintenance of tripods and towers, and any attachments to tripods and towers. The use of licensed and qualified contractors is highly recommended.
- Read all applicable instructions carefully and understand procedures thoroughly before beginning work.
- Wear a hardhat and eye protection, and take other appropriate safety precautions while working on or around tripods and towers.
- Do not climb tripods or towers at any time, and prohibit climbing by other persons. Take reasonable precautions to secure tripod and tower sites from trespassers.
- Use only manufacturer recommended parts, materials, and tools.

Utility and Electrical
- You can be killed or sustain serious bodily injury if the tripod, tower, or attachments you are installing, constructing, using, or maintaining, or a tool, stake, or anchor, come in contact with overhead or underground utility lines.
- Maintain a distance of at least one-and-one-half times structure height, 6 meters (20 feet), or the distance required by applicable law, whichever is greater, between overhead utility lines and the structure (tripod, tower, attachments, or tools).
- Prior to performing site or installation work, inform all utility companies and have all underground utilities marked.
- Comply with all electrical codes. Electrical equipment and related grounding devices should be installed by a licensed and qualified electrician.

Elevated Work and Weather
- Exercise extreme caution when performing elevated work.
- Use appropriate equipment and safety practices.
- During installation and maintenance, keep tower and tripod sites clear of un-trained or non-essential personnel. Take precautions to prevent elevated tools and objects from dropping.
- Do not perform any work in inclement weather, including wind, rain, snow, lightning, etc.

Maintenance
- Periodically (at least yearly) check for wear and damage, including corrosion, stress cracks, frayed cables, loose cable clamps, cable tightness, etc. and take necessary corrective actions.
- Periodically (at least yearly) check electrical ground connections.

WHILE EVERY ATTEMPT IS MADE TO EMBODY THE HIGHEST DEGREE OF SAFETY IN ALL CAMPBELL SCIENTIFIC PRODUCTS, THE CLIENT ASSUMES ALL RISK FROM ANY INJURY RESULTING FROM IMPROPER INSTALLATION, USE, OR MAINTENANCE OF TRIPODS, TOWERS, OR ATTACHMENTS TO TRIPODS AND TOWERS SUCH AS SENSORS, CROSSARMS, ENCLOSURES, ANTENNAS, ETC.
PLEASE READ FIRST

About this manual

Please note that this manual was originally produced by Campbell Scientific Inc. (CSI) primarily for the US market. Some spellings, weights and measures may reflect this origin.

Some useful conversion factors:

<table>
<thead>
<tr>
<th>Unit</th>
<th>Conversion Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Area</strong></td>
<td>1 in² (square inch) = 645 mm²</td>
</tr>
<tr>
<td><strong>Length</strong></td>
<td>1 in. (inch) = 25.4 mm</td>
</tr>
<tr>
<td></td>
<td>1 ft (foot) = 304.8 mm</td>
</tr>
<tr>
<td></td>
<td>1 yard = 0.914 m</td>
</tr>
<tr>
<td></td>
<td>1 mile = 1.609 km</td>
</tr>
<tr>
<td><strong>Mass</strong></td>
<td>1 oz. (ounce) = 28.35 g</td>
</tr>
<tr>
<td></td>
<td>1 lb (pound weight) = 0.454 kg</td>
</tr>
<tr>
<td><strong>Pressure</strong></td>
<td>1 psi (lb/in²) = 68.95 mb</td>
</tr>
<tr>
<td><strong>Volume</strong></td>
<td>1 US gallon = 3.785 litres</td>
</tr>
</tbody>
</table>

In addition, part ordering numbers may vary. For example, the CABLE5CBL is a CSI part number and known as a FIN5COND at Campbell Scientific Canada (CSC). CSC Technical Support will be pleased to assist with any questions.

About sensor wiring

Please note that certain sensor configurations may require a user supplied jumper wire. It is recommended to review the sensor configuration requirements for your application and supply the jumper wire is necessary.

CS120A and CS125 Visibility and Present Weather Sensors

1. Introduction

The CS120A is a visibility sensor. The CS125 additionally detects and reports present weather in the form of SYNOP, METAR or NWS codes. The CS125 has the same specification for visibility measurement as the CS120A. It is possible to upgrade a CS120A to a CS125, please contact Campbell Scientific for more details.

The sensors are infrared forward scatter visibility and present weather sensors for automatic weather stations including road, marine and airport based stations. They both use the well-established forward scatter system for visibility measurement, utilising a 42° scatter angle. The CS125 uses high speed sampling to reduce missed events and improves response to other suddenly changing conditions.

The CS125 has a temperature sensor mounted in the cross arm used as part of the process for identifying precipitation.

When an optional CS215 temperature and RH sensor is connected, the CS125 can distinguish wet and dry obscuration (for example mist and haze) and make more precise discrimination between liquid and frozen precipitation.

Dew heaters are provided to keep the sensor optics clear of condensation and more powerful hood heaters to prevent the build up of snow or ice.
1.1 General Safety

This manual provides important safety considerations for the installation, operation and maintenance of the sensor. These safety considerations are classified into three levels:

---

**WARNING**

Warnings alert the installer or user to serious hazards. Ignoring these warnings could result in injury or death and/or irrevocable damage to the sensor unit.

---

**CAUTION**

Cautions warn of potential hazards. Ignoring these cautions could result in the sensor being damaged and data being lost.

---

**NOTE**

Notes highlight useful information in the installation, use and maintenance of this product. These should be followed carefully in order to gain the maximum benefit from the use of this product.

1.2 Sensor Unit Safety

The sensor has been checked for safety before leaving the factory and contains no internally replaceable or modifiable parts.

---

**WARNING**

Do not modify the sensor unit. Such modifications will lead to damage of the unit and could expose users to dangerous light levels and voltages.

---

**WARNING**

In unusual failure modes and environmental conditions the sensor hood could become hot. In normal operation they will be at ambient temperature or slightly above.

---

**CAUTION**

Ensure that the correct voltage supply is provided to the sensor.

1.3 Recommended Tools

The following tools are recommended:

- 10 mm open spanner (for grounding boss, must be open)
- 13 mm spanner
- 19 mm open spanner (for cable glands, must be open)
- 2 mm flat screwdriver
- Number 2 cross head screwdriver
1.4 Quickstart

The sensor is shipped set to the following default communication RS232, 8N1, 38400 baud, a sensor ID = 0 and set to transmit default messages, full format, visibility only for the CS120A, SYNOP present weather full format for the CS125, at 1 minute intervals (see Section 11).

To start using the CS120A or CS125, first connect a DC supply matching the specification in Section 3.1 to the red and black wires on the ‘D-connector’ (see Fig. 8-3) and connect to a PC communications port with a terminal emulator set to RS232, 38400 baud, 8N1. After a couple of minutes, data messages will be received. Typing `open 0' will access the menu structure, see Section 15.

3. Technical specification

3.1 Electrical specification

<table>
<thead>
<tr>
<th>Main power supply for DSP and dew heaters</th>
<th>Minimum Value</th>
<th>Nominal Value</th>
<th>Maximum Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power supply, (DC only)</td>
<td>7V</td>
<td>12V</td>
<td>28V**</td>
</tr>
<tr>
<td>Current consumption sampling continuously with dew heaters active (at 12V DC)</td>
<td>-</td>
<td>200 mA</td>
<td>248 mA</td>
</tr>
</tbody>
</table>
Current consumption sampling continuously with dew heaters disabled (at 12V DC) | 110 mA | 151 mA
---|---|---
Current consumption without any sampling occurring and dew heaters disabled (at 12V DC) | 21 mA | 30 mA
Active power consumption with dew heaters and RS232 communications interface active(2,3) (at 12V DC) | 200 mA | 250 mA

**Hood heater power supply**

| Hood heater voltage (AC or DC) | 24V(3) | 30V(4) |
| Hood heater wattage (at 24V AC or DC) | 60W(3) | - |

**User alarm outputs**

| User output high level (at 85°C) | 3.8V | - | - |
| User output high level (at 25°C) | 4.13V | - | - |
| User output low (All temperatures) | 0.25V | - | 0.55V |
| User output current | - | - | 32 mA |

(1) If a CS215 is being used with a CS125 the supply voltage should not exceed 28V.

(2) The RS232 communications interface will automatically turn itself off when not transmitting.

(3) If hood heaters are not being used ensure ‘Hood heater override’ (details in Section 13) is set to off.

(4) It is recommended that the hood heaters are run at 24V AC/DC. It’s possible to run the heaters at any voltage below 24V but the heaters will generate proportionally less heat reducing their ability to prevent ice build-up.

(5) Each hood takes 30W, 60W is the total for both hoods on the sensor together.

---

**CAUTION**

If a CS215 is being used the supply voltage should not exceed 28V.

</tr>
</tbody>
</table>

(1) The RS232 communications interface will automatically turn itself off when not transmitting.

(2) The ground of the CS125 and the ground of any RS485 equipment cannot be further apart than this voltage. The CS125 ground (pin 1) on connector B, see page 12, can be connected to the ground of the host equipment. This will reduce any parasitic currents.

4.2 Supported data rates and formats

Serial setting 8N1

Supported data rates
- 1200 bps
- 2400 bps
- 9600 bps
- 19200 bps
- 38400 bps - default
- 57600 bps
- 115200 bps
Supported formats

- RS232 (Full duplex only), default
- RS485 (Half duplex)
- 8 bit data bytes
- 1 stop bit
- Parity checking is not supported as most communication protocols used by the CS125 have built in checksums as well as checks that communications have been understood.

5. Environmental specifications

</tbody>
</table>

(1) Extended temperature ranges are only guaranteed if the sensor has been tested by Campbell Scientific and verified within this temperature range. Some degradation of absolute accuracy can be expected at the extremes of the extended ranges.
6. Mechanical specifications

6.1 Dimensions

6.2 Weights

- Sensor weight: 3 Kg
- Shipping weight: 6 Kg (including packing box)

6.3 Mounting

- Sensor mounting: Bracket mounts on a vertical pole 32-52.5 mm diameter. The mounting bracket has cut-outs for band clamps for larger diameter masts.

7. Installation procedure

The sensor measures environmental variables and is designed to be located in harsh weather conditions. However there are a few considerations to take into account if accurate and representative data from a site are to be obtained.
The descriptions in this section are not exhaustive. Please refer to meteorological publications for further information on locating weather instruments.

The sensor should be sited in a position representative of local weather conditions and not of a specific microclimate (unless the analysis of microclimate weather is being sought).

The sensor has good resistance to background light but it is a good idea to avoid locations where the transmitter is pointing at a light scattering or reflecting surface.

To give non-microclimatic measurements the sensor should be sited away from possible physical obstructions that could affect the fall of precipitation. The sensor should also be positioned away from sources of heat, electrical interference and in such a position as to not have direct light on the sensor lenses. Whenever possible, the sensor should be located away from windbreaks.

Several zones have been identified upwind and downwind of a windbreak in which the airflow is unrepresentative of the general speed and direction. Eddies are generated in the lee of the windbreak and air is displaced upwind of it. The height and depth of these affected zones varies with the height and to some extent the density of the obstacle.

Generally, a structure disturbs the airflow in an upwind direction for a distance of about twice the height of the structure, and in a downwind direction for a distance of about six times the height. The airflow is also affected to a vertical distance of about twice the height of the structure. Ideally, therefore, the sensor should be located outside this zone of influence in order to obtain representative values for the region.

In order to reduce the service frequency with the unit, the sensor should be placed away from sources of contamination, in the case of roadside monitoring; larger mounting poles can be used. More regular maintenance will be required when the instrument is placed in areas where contamination is unavoidable or where measurements may be safety critical.

The WMO recommend a sample volume height of 1.5 m. However, for applications such as aviation or road visibility other heights may be appropriate.
NOTE
If operating a sensor indoors it is likely that there will be sources of light and/or reflections that will create false readings and erratic results.

NOTE
If carrying out simple checks, blocking a lens or the sample volume will simulate an INCREASE in visibility not a decrease.

7.1 Equipment grounding

The sensor must be properly grounded. It is sufficient to ground the mounting bracket and if the sensor is connected to a grounded metal mast, and in electrical contact with it, then this will be sufficient. Otherwise, the mounting bracket should be earthed and a grounding boss is supplied to allow this.

A ground wire with a minimum cross section of 6 mm² and maximum length of 5 m should be used.

The pole and foundations of a pole mounted installation will provide some basic lightning protection and protection against radio frequency interference and should also be correctly grounded.

7.2 Mounting the sensor

A quick release pole mounting kit is supplied with the sensor.

If a power supply enclosure has been supplied with the sensor it can be mounted on the pole, near its base using the brackets supplied with the enclosure.
Alternatively the power supply can be mounted elsewhere, e.g. on a wall at some distance from the sensor. The power supply enclosure should be mounted away from the sensor head to avoid wind flow disturbance or rain drops bouncing back up into the sensor’s sensing volume.

**CAUTION**

Take care not to overtighten the nuts on the bolts, as it may be possible to distort and/or damage the brackets or DSP plate by doing so, and/or the nuts may seize up. Only tighten the nuts to a degree necessary to hold the sensor firmly in place.

Where the sensor is to be mounted onto another type of mast, please refer to the manual for that mast for mounting details.

**CAUTION**

Ensure that the sensor is mounted according to the figure below. Do not reposition, once fixings are tightened, by forcing the arms of the unit as this can cause damage.

Slots are provided to allow band clamps to be used with larger diameter masts.

**CAUTION**

Do not remove the mounting plate as this will compromise resistance to water ingress.

![Figure 7-3. Mounting arrangement](image)

If you need to mount the sensor to a flat surface, remove the plastic formers from the mounting brackets and use the holes as shown in Figure 7-4.

**NOTE**

If mounting to a flat surface ensure that there is no obstruction to airflow through the sample volume.
7.3 Optional Campbell Scientific Mount

A Campbell Scientific ‘optical sensor mount’, part number 28679, is available. This will put the sample volume at about 1.5 m in compliance with the WMO ‘Guide to Meteorological Instruments and Methods of Observation’, 7th Edition, Section 9.3.4.
If one is to be used, follow the installation instructions below.

The mount should be installed on a concrete foundation. If one does not already exist then a concrete foundation should be constructed at least 600 mm square and 600 mm deep. Ensure the ground consistency is not too loose and will be able to support the mount and concrete foundation.
Drill four 12 mm diameter holes using the mount base as a template or following the drawing below to a depth of 77 mm.

![Figure 7-6. Mounting footprint](image)

Clean the holes of all debris.

Place washers and nuts on the ends of the wedge anchors supplied (to protect the threads during installation).

Hammer the wedge anchors into the holes until the start of the threads are below the surface.

Tighten the nuts until about 25 mm of thread protrudes above the surface.

Remove the washers and nuts from the protruding length screw. Then lower the mount into place.

Finally secure the mount with the washers and nuts.

If the surface is not level and flat it may be necessary to add washers under the base on one or more of the foundation screws.
8. Sensor internal connectors’ description

The sensor has four standard IP66 rated glands. The first gland is by default used by the power/communications line. This comprises the 7-30 V for the main electronics, and the serial communications wires. The sensor is supplied with 5 m cable already connected.

The second gland is used for the 24 V feeds for the hood heaters fitted with a 5 m cable.

Glands 3 and 4 are spare. If user alarms are connected they usually use gland 3 and if a CS215 is fitted this usually uses gland 4.

If you need to run cables through the cable glands follow these guidelines. If a torque wrench is available use a torque of 2.5 Nm (do not over tighten).

Otherwise tighten with fingers as tight as possible and then add a further ¾ turn with a 19 mm spanner (do not over tighten).

The glands are suitable for cables between 5 and 9 mm diameter.

---

**CAUTION**
If the power cable is incorrectly wired to the sensor then damage can be done to the unit.

**CAUTION**
10 m is the longest length of the cable type supplied recommended. In particular, additional RS485 communication should be twisted pair. Please contact Campbell Scientific if you wish to use a longer length of cable.

---

![Connections Diagram](image.png)

*Figure 8-1. Connections*
A configuration cable, part number 28680, is available from Campbell Scientific that plugs directly into connector B, in place of the normal connector and cable.

**NOTE**
If the lid is removed take care not to overtighten the fixing screws. A small gap should remain between the lid and box.

The configuration cable is fitted with a 9-way D connector for use with a PC serial port or USB to serial adaptor.

### Connector A - Five way connector

<table>
<thead>
<tr>
<th>Pin number</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 1</td>
<td>+ve supply</td>
<td>Main electronics +ve supply input</td>
</tr>
<tr>
<td>Pin 2</td>
<td>0V</td>
<td>Auxiliary Electronics 0V. Common with the main electronics 0V.</td>
</tr>
<tr>
<td>Pin 3</td>
<td>Hood low</td>
<td>This is for the hood heater power supply. If the hood heater supply is DC it should be the negative connection and if it is AC it should be the ‘neutral’ or ‘ground’ connection if there is one.</td>
</tr>
<tr>
<td>Pin 4</td>
<td>0V</td>
<td>Auxiliary Electronics 0V. Common with the main electronics 0V.</td>
</tr>
<tr>
<td>Pin 5</td>
<td>Hood high</td>
<td>This is for the hood heater power supply. If the hood heater supply is DC it should be the positive connection.</td>
</tr>
</tbody>
</table>

**CAUTION**
To avoid damage to noise filters on the hood heater inputs if the heater voltage is DC the –ve connection should be made to pin 3 and the +ve to pin 5. If the heater voltage is AC with a ground or neutral wire then this should be connected to pin 3. Pin 3 should not be more than 5 volts from the main electronics 0V.

### Connector B - Three way connector

<table>
<thead>
<tr>
<th>Pin number</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 1</td>
<td>0V</td>
<td>0V connection for serial communications. This connection is common with the main electronics 0V (Connector A, pin 2).</td>
</tr>
<tr>
<td>Pin 2</td>
<td>Receive</td>
<td>RS232 receive line. Also, acts as the Y transmit line in RS485 half duplex mode and the A receive line</td>
</tr>
<tr>
<td>Pin 3</td>
<td>Transmit</td>
<td>RS232 transmit line. Also, acts as the Z transmit line in RS485 half duplex mode and the B receive line</td>
</tr>
</tbody>
</table>

It may be necessary to use a 120 ohm termination resistor to reduce signal distortion when using RS485 for cable runs over about 500 m and baud rates above 38400. It should be connected between pins 2 and 3.

### Connector C - Four way connector

<table>
<thead>
<tr>
<th>Pin number</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 1</td>
<td>0V</td>
<td>0V connection for user alarms. This connection is common with the main electronics 0V (Connector A, Pin 2).</td>
</tr>
<tr>
<td>Pin 2</td>
<td>User 2</td>
<td>Output for user alarm 2</td>
</tr>
<tr>
<td>Pin 3</td>
<td>0V</td>
<td>0V connection for user alarms. This connection is common with the main electronics 0V (Connector A, Pin 2).</td>
</tr>
<tr>
<td>Pin 4</td>
<td>User 1</td>
<td>Output for user alarm 1</td>
</tr>
</tbody>
</table>
### CS125 only

<table>
<thead>
<tr>
<th>Pin number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 1</td>
<td>+12V</td>
</tr>
<tr>
<td>Pin 2</td>
<td>SDI-12</td>
</tr>
<tr>
<td>Pin 3</td>
<td>0V</td>
</tr>
</tbody>
</table>

**NOTE**

To use these connections it is necessary to either use the cable gland taking the hood heater power or, if the hood heater is also required, to use different cables to those supplied. Please contact Campbell Scientific if you need any advice on choice of cable.

### 8.1 Sensor recommended wiring using Campbell Scientific cables (this cable is supplied already connected as standard)

The sensor is provided pre-wired with a default 5 m power and communications cable which is terminated at one end with a 9 pin D-connector (DB9). The D-connector can be connected directly to a PC or to a datalogger such as the Campbell Scientific CR1000 using a suitable interconnecting cable such as the SC110. If another type of connection is required then the D-connector should be removed.

![Communications and power connections](image)

*Figure 8-2. Communications and power connections*
9. CS215 T/RH Sensor (CS125 only)

The CS125 has a temperature sensor mounted in the crossarm that is used in determining precipitation type.

A CS215 temperature and RH sensor can be connected to a CS125. This is recommended as it will improve the performance of the CS125 in identifying precipitation and allows it to, for example, distinguish between mist and haze. Precipitation identification at temperatures close to freezing will be much improved by a CS215 and its use is highly recommended in regions where temperatures close to 0°C are common if information on precipitation type is important. It also allows RH information to be included in data messages.

If a CS215 is connected then the temperature used for assessment of precipitation type and included in data messages will come from the CS215 instead of the temperature sensor mounted in the cross arm.
The connections for the CS215 are shown below. The CS215 itself can be mounted in a Met20 screen on the same mast as the CS125. The screen can be mounted on the top section of an OSM1 optical mast below a CS125.

WMO – No. 8, 2.1.4.1 recommends temperature measurement at a height of between 1.2 and 2.0 m above ground. The screen should be below the height of the CS125 electronics box.

Figure 9-1. Connection for the optional CS215 T/RH sensors

10. Functions of the internal switches

The sensor is equipped with four switches located within the main enclosure. These switches perform certain functions at power up, their functions are detailed below.

<table>
<thead>
<tr>
<th>COLOUR</th>
<th>FUNCTION</th>
<th>PIN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>+12V</td>
<td>1</td>
</tr>
<tr>
<td>Green</td>
<td>SDI-12</td>
<td>2</td>
</tr>
<tr>
<td>Black</td>
<td>Power Ground</td>
<td>3</td>
</tr>
<tr>
<td>Clear</td>
<td>Shield</td>
<td>3</td>
</tr>
<tr>
<td>White</td>
<td>Power Ground</td>
<td>3 or NC</td>
</tr>
</tbody>
</table>
The switches are only read during the power up sequence of the sensor. This means that if the switches are pressed whilst the sensor is running nothing will happen, the sensor will need to be power cycled leaving at least 10 seconds with the sensor off for any of their functions to be performed.

**Figure 9-2. Internal switches**

<table>
<thead>
<tr>
<th>Internal switch functions</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Switch number</strong></td>
<td><strong>Function</strong></td>
</tr>
<tr>
<td>4</td>
<td><em>Reserved for future use</em></td>
</tr>
<tr>
<td>3</td>
<td>When switched to the ON position and the sensor is power cycled this switch temporarily sets the sensor communications port to a default RS232 communication state at 38400 baud. This is useful during field tests or maintenance when the sensor has been remotely configured for RS485 mode or a baud rate your PC does not support. This change is temporary and will not be stored to flash. However, if the menu system is accessed and a ‘Save and exit’ command is performed these new data rate settings will be committed to flash. Once this switch is returned to its OFF position and the sensor is power cycled the sensor will return to its previous communications settings. <em>Reserved for future use, set to OFF.</em></td>
</tr>
</tbody>
</table>
When switched to the ON position this switch will reset the sensor to its factory default values. This reset will affect all communication settings. This will take immediate effect upon power up.

NOTE: To use this the power supply must be stable. Do not leave this switch set permanently.

<table>
<thead>
<tr>
<th>NOTE</th>
</tr>
</thead>
<tbody>
<tr>
<td>If the lid is removed take care not to overtighten the screws when it is replaced. A small gap should remain between the lid and box.</td>
</tr>
</tbody>
</table>

11. Message Formats: A breakdown of the different default outputs of the sensor – Basic/Partial/Full

The sensor has twelve different message formats available to the user. All parameters are space delimited with a unique start and end character allowing easy storage into any logger (see Section 15 on how to set default outputs). The SYNOP Full Format message is the default message for the CS125 and the Full Format Visibility only message is the default for the CS120A.

<table>

</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>One minute average</td>
</tr>
<tr>
<td>10</td>
<td>Ten minute average</td>
</tr>
</tbody>
</table>

Note: In accordance with WMO requirements the sensor produces visibility measurement that are either one or ten minute rolling averages that are updated at the chosen output interval or when the sensor is polled. Those averages are not direct averages of MOR measurements but are averages of extinction coefficient and that average is then used to calculate the MOR for that period. As the relationship between extinction coefficient and MOR is not linear it is possible to see quite rapid changes in MOR that might not be expected if the result was a rolling average of MOR. Please consider this, especially when testing the sensor with artificial obscurants or using the calibration disc.

### User alarms

</tr>
</tbody>
</table>
Errors are checked every 10 seconds and the next message output is updated with the following exceptions:

Signature error is checked and reset at power up.

Flash read and write errors are checked when flash memory is updated, for example when changes are made through the memory structure. They are also reset on power up.

Particle limit is checked every minute and reset when read.

11.5 Example sensor message outputs

Basic format (visibility only)

```
0 9 0 6682 M ABCD
```

SYNOP present weather partial format

```
4 9 0 60 6682 M 0 0 54 4.5 63 20.2 91 ABCD
```
**METAR present weather full format**

8 9 0 60 6682 M 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 54 4.5 63 +RA 20.2 91 ABCD

Where:
- 9 is the sensor id
- 60 is the message interval (60 seconds)
- 6682 is the visibility in metres
- M is the visibility units (metres)
- 54 is particle count
- 4.5 is intensity (4.5 mm/hr)
- 63 is the SYNOP code (heavy rain)
- +RA is the METAR code (heavy rain)
- 20.2 is the temperature (20.2 deg. C)
- 91 is the RH (91%)
- ABCD is the checksum

**11.6 Custom message format**

The custom message format allows the CS120A/CS125 message to be modified to meet particular requirements. The custom message contains a fixed basic set of variables and up to 16 additional fields. (Note: the custom message output is only available on OS7 and above). The custom message is as follows:

<table>
<thead>
<tr>
<th>Custom format</th>
</tr>
</thead>
<tbody>
<tr>
<td>STX</td>
</tr>
<tr>
<td>0x01</td>
</tr>
</tbody>
</table>

There are two ways to configure the custom message. The first is through the user menu system. The second is through the use of logger commands. These logger commands are MSGSET and MSGGET.

To configure the message using the user menu you will need to enter the menu, see Section 15.

<table>
<thead>
<tr>
<th>CS125 MESSAGE - SUB 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set the message output format. Current format is: FULL SYNOP</td>
</tr>
<tr>
<td>- Basic = 0</td>
</tr>
<tr>
<td>- Partial = 1</td>
</tr>
<tr>
<td>- Full = 2</td>
</tr>
<tr>
<td>- Basic SYNOP = 3</td>
</tr>
<tr>
<td>- Partial SYNOP = 4</td>
</tr>
<tr>
<td>- Full SYNOP = 5</td>
</tr>
<tr>
<td>- Basic METAR = 6</td>
</tr>
<tr>
<td>- Partial METAR = 7</td>
</tr>
<tr>
<td>- Full METAR = 8</td>
</tr>
<tr>
<td>- Generic Basic SYNOP = 9</td>
</tr>
<tr>
<td>- Generic Partial SYNOP = 10</td>
</tr>
<tr>
<td>- Generic Full SYNOP = 11</td>
</tr>
<tr>
<td>- Custom output = 12</td>
</tr>
<tr>
<td>-&gt;</td>
</tr>
</tbody>
</table>
Return to the message menu and select option 7. You should now be presented with the list of options shown below:

```
CS125 MESSAGE - SUB 4
Configure the message output format:
1 - Averaging duration = 0
2 - User alarms = 0
3 - System alarms = 0
4 - Dirty windows values = 0
5 - Sensor serial number = 0
6 - Particle count = 0
7 - Intensity = 0
8 - Accumulation = 0
9 - Generic SYNOP = 0
10 - SYNOP code = 0
11 - METAR code = 0
12 - NWS code = 0
13 - Temperature (Degrees C) = 0
14 - Humidity (%) = 0
Or, type 0 to exit without changes.
->
```

Enter the number of a custom message field you wish to use and type return. The screen will update with a 1 next to the chosen field. Repeat for each field you want then exit the menu. The changes take effect after selecting “Exit and Save” from the main menu.

**Example**

In the example below selecting options 4, 5, 10 and 13 puts dirty windows values, sensor serial number, SYNOP code and temperature into the custom message.

```
CS125 MESSAGE - SUB 4
Configure the message output format:
1 - Averaging duration = 0
2 - User alarms = 0
3 - System alarms = 0
4 - Dirty windows values = 1
5 - Sensor serial number = 1
6 - Particle count = 0
7 - Intensity = 0
8 - Accumulation = 0
9 - Generic SYNOP = 0
10 - SYNOP code = 1
11 - METAR code = 0
12 - NWS code = 0
13 - Temperature (Degrees C) = 1
14 - Humidity (%) = 0
Or, type 0 to exit without changes.
->
```

This would give the following output:

```
12 0 0 4 111 M 2 1 E1007 30 25.4 D2E6
```
Above the custom fields are “2 1 E1007 30 25.4”. The emitter is reading 2% contamination, the detector is reading 1% contamination, the serial number is E1007, the SYNOP code is 30 and the temperature is 25.4 degrees Celsius. There are a number of fields that can send out more than one value. These are detailed below.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Number of values output</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Averaging duration</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>User alarms</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>System alarms</td>
<td>12</td>
</tr>
<tr>
<td>4</td>
<td>Dirty windows values, as percentages, emitter followed by detector</td>
<td>2</td>
</tr>
<tr>
<td>5</td>
<td>Sensor serial number</td>
<td>1</td>
</tr>
<tr>
<td>6</td>
<td>Particle count (^1), particles in the previous minute</td>
<td>1</td>
</tr>
<tr>
<td>7</td>
<td>Intensity (^1), mm/hr</td>
<td>1</td>
</tr>
<tr>
<td>8</td>
<td>Accumulation (^1), over a period of one minute</td>
<td>1</td>
</tr>
<tr>
<td>9</td>
<td>Generic SYNOP (^1)</td>
<td>1</td>
</tr>
<tr>
<td>10</td>
<td>SYNOP code (^1)</td>
<td>1</td>
</tr>
<tr>
<td>11</td>
<td>METAR code (^1)</td>
<td>1</td>
</tr>
<tr>
<td>12</td>
<td>NWS code (^1)</td>
<td>1</td>
</tr>
<tr>
<td>13</td>
<td>Temperature (degrees C) (^1)</td>
<td>1</td>
</tr>
<tr>
<td>14</td>
<td>Humidity ((%)) (^{1,2})</td>
<td>1</td>
</tr>
</tbody>
</table>

\(^1\) These options are only available with a CS125

\(^2\) Only outputs a valid value when a CS215 temperature and humidity probe is connected

12. Interface methods – Device Configuration Utility/Command line/Menu

The sensor can be set up and controlled in one of three ways.

The first method is by using Campbell Scientific’s Device Configuration Utility Software (DevConfig) which is included with each delivery on the manuals/resource disk. This software allows an easy menu driven interface for configuring the sensor on any Microsoft™ based personal computer. All settings can be accessed using this program.

The program includes online help instructions that describe its general use with the sensor and also how to load an operating system.

The Device Configurator can also be used as a terminal emulator to use the built-in menu system of the sensor and to access its calibration menu.

The second method is by using the command line interface where discrete commands are sent without response from the sensor. This would be the preferred method of setting up a sensor if it was connected to a logger for instance. The configuration setting commands can be sent via a logger to the sensor removing the need for a local PC to set up the unit.
The third method is by using the simple menu interface built into the sensor communicating via RS232 or RS485, using a terminal emulator program. This menu system gives access to the more common settings.

All three of these methods use the sensor's serial port A to communicate with the sensor. Configuration cable part number 28680, described in Section 8.1, can be used.

### 12.1 Configuring a PC for talking to the sensor

Described below is the procedure for setting up communications using a terminal emulator program. The terminal emulators built into many Campbell Scientific software products can also be used.

The following settings should then be used by default:

- Bits per second: 38400
- Data bits: 8
- Parity: none
- Stop bits: 1
- Flow control: none

Ensure that if the baud rate of the unit has been adjusted and then the corresponding bits per second value is entered in the port settings of the terminal emulator. The sensor should now be ready to accept commands.

It is possible to set the sensor into the default communication state via one of the internal switches on the sensor main board. See Section 9.

### 13. Definition of the variables that can be set by the user on the sensor

Both DevConfig and the command line interface can access all the user configurable variables within the sensor. The acceptable range and the identification number for these variables are listed below along with a short description.

<table>
<thead>
<tr>
<th>ID</th>
<th>Name</th>
<th>Range</th>
<th>Description</th>
<th>Factory default</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Sensor ID</td>
<td>0-9</td>
<td>Separate ID used as an extra identifier for a particular sensor on a network.</td>
<td>0</td>
</tr>
</tbody>
</table>
| 2  | User Alarm 1 Enabled  | 0-1        | User alarm one activation state
  0 = Alarm one disabled
  1 = Alarm one enabled          | 0               |
| 3  | User Alarm 1 Active   | 0-1        | 0 = Check if distance is less than ‘User alarm 1 Distance’
  1 = Check if distance is greater than ‘User alarm 1 Distance’ | 0               |
| 4  | User Alarm 1 Distance | 0-60000    | Distance value that alarm one will trigger against.
  This value will correspond to metres or feet depending upon which is selected in ‘Visibility Unit’ | 10000            |
<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Value Range</th>
<th>Description</th>
</tr>
</thead>
</table>
| 5   | User Alarm 2 Enabled              | 0-1         | User alarm two activation state  
0 = Alarm two disabled  
1 = Alarm two enabled |
| 6   | User Alarm 2 Active               | 0-1         | 0 = Check if distance is less than ‘User alarm 2 Distance’  
1 = Check if distance is greater than ‘User alarm 2 Distance’ |
| 7   | User Alarm 2 Distance             | 0-60000     | Distance value that alarm one will trigger against.  
This value will correspond to metres or feet depending upon which is selected in ‘Visibility Unit’ |
| 8   | Baud rate                         | 0-6         | Baud rate for the main RS232/RS485 interface  
0 = 115200 bps  
1 = 57600 bps  
2 = 38400 bps  
3 = 19200 bps  
4 = 9600 bps  
5 = 2400 bps  
6 = 1200 bps |
| 9   | Serial number                     | -           | Internal serial number for the sensor.  
(Read only) |
| 10  | Visibility Unit                   | M or F      | Unit the visibility value will be presented as  
M = metres  
F = feet |
| 11  | Message Interval                  | 1-3600      | Interval in seconds between outputs in continuous mode.  
This value has no effect if polled mode has been selected in ‘Measurement mode’ |
| 12  | Measurement mode                  | 0-1         | Selects polled or continuous modes.  
In continuous mode the sensor will output a string in the format as set by ‘Message Format’ at regular intervals as defined by ‘Continuous Interval’.  
0 = Continuous mode  
1 = Polled mode |
| 13  | Message Format                    | 0-12        | Output message  
0, 1 and 2 = Basic, partial or full visibility messages  
3, 4 and 5 = Basic, partial or full SYNOP messages  
6, 7 and 8 = Basic, partial or full METAR messages  
9, 10 and 11 = Generic basic, partial or full SYNOP messages  
12 = Custom message |
| 14  | Serial port protocol              | 0-1         | Selects the physical serial interface  
0 = RS232 mode  
1 = RS485 mode |
| 15  | Averaging period                  | 1 or 10     | The period of time that the visibility value should be averaged over.  Either one minute or ten. |
| 16  | Sample timing                     | 1-60        | Used to define the time interval between sampling the volume.  It is recommended that this value is left at one except when very low power demands are needed.  For example:  
1 = Sample every second  
2 = Sample one second in every two  
3 = Sample one second in every three etc. |
<table>

<td></td>
</tr>
</tbody>
</table>

(1) Hood heater override needs to be set to '1' (off) when either no hood heaters are installed or the hood heaters have no power connected to them. This will save power as the relay is not enabled at low temperatures in this mode.

(2) If disabled the sensor does not check the validity of received data against the checksum sent. It is, however, recommended that checksum checking is enabled to remove any chance of the sensor being configured incorrectly by accident.

(3) CS125 only.

14. Command line mode

The command line interface is broken down into three major commands. These are GET, SET and POLL. The GET command is used to request all current user settable values from the sensor. The SET commands sets user settable values and the POLL command is used to request the current visibility and/or alarm conditions from the sensor.

The sensor can be configured to expect any commands sent to it to include a valid checksum. For simple commands, e.g. GET and POLL, fixed value checksums can be used (see the example programs). For more complex SET commands the checksum needs to be calculated (see Appendix B). The use of the checksum is disabled by default. It is recommended that the checksum functionality is enabled where possible, especially when long cable runs are used, or in electronically noisy environments.

14.1 The SET command

The set command is used to configure the sensor via the command line. The SET command is a single space delimited string that can be sent from any data logger or PC equipped with serial communications. The SET command and the ‘Device Configuration Utility’ software access identical settings within the sensor, please refer to the ‘Device Configuration Utility’ section of this document for a more detailed breakdown of the setting available here. This command is used to change the default power up state of the sensor. See Section 14.2 if a setting is going to be changed on a regular basis e.g. heater controls.

See Section 12 for more information on the values used by the ‘SET’ command.

(1) These values are shown in hexadecimal format not ASCII.
(2) As entered on a keypad.
(3) CS125 only.

### 14.1.1 Example of a SET Command

```
SET:0:0 1 1 1000 1 0 15000 2 0 M 60 1 2 0 1 1 0 0 0 1 7 80 :68A3:
```

### 14.2 The SETNC Command

The format of the SETNC command is nearly exactly the same as the SET command. The only functional difference is that the SETNC command does not commit the values set into flash memory. This means that the next time the sensor is power cycled it will revert back to its previous settings. This command should be used when a setting in the sensor is changed regularly, e.g. heater functions, as this command avoids the risk of wearing out the flash storage memory. Note: this includes communication data rates as well.
14.2.1 Example of a SETNC Command

```
SETNC:0:0 1 1 1000 1 0 15000 2 0 M 60 1 2 0 1 1 0 0 0 1 7 80 :XXXX:
```

14.3 The MSGSET Command

The user customisable message format can be configured using the MSGSET command.

When a valid MSGSET command is issued a MSGGET response comes back from the sensor.

<td></td>
</tr>
<tr>
<td>4000</td>
<td>Reserved</td>
<td></td>
</tr>
<tr>
<td>2000</td>
<td>Humidity (%)</td>
<td></td>
</tr>
</tbody>
</table>
The HEX value is the sum of all the required fields.

The following example shows the calculation of the HEX value to use a MSGSET message to set a CS125 to output temperature, SYNOP code, sensor serial number, dirty windows values and system alarms.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>8000</td>
<td>Reserved</td>
</tr>
<tr>
<td>4000</td>
<td>Reserved</td>
</tr>
<tr>
<td>2000</td>
<td>Humidity (%)</td>
</tr>
<tr>
<td>1000</td>
<td>Temperature (Degrees C)</td>
</tr>
<tr>
<td>0800</td>
<td>NWS code (3)</td>
</tr>
<tr>
<td>0400</td>
<td>METAR code</td>
</tr>
<tr>
<td>0200</td>
<td>SYNOP code (3)</td>
</tr>
<tr>
<td>0100</td>
<td>Generic SYNOP (3)</td>
</tr>
<tr>
<td>0080</td>
<td>Accumulation (3)</td>
</tr>
<tr>
<td>0040</td>
<td>Intensity (3)</td>
</tr>
<tr>
<td>0020</td>
<td>Particle count (3)</td>
</tr>
<tr>
<td>0010</td>
<td>Sensor serial number</td>
</tr>
<tr>
<td>0008</td>
<td>Dirty windows values</td>
</tr>
<tr>
<td>0004</td>
<td>System alarms</td>
</tr>
<tr>
<td>0002</td>
<td>User alarms</td>
</tr>
<tr>
<td>0001</td>
<td>Averaging duration</td>
</tr>
</tbody>
</table>

The hex value is the hexadecimal sum of the hex values of the chosen fields (in bold text).
The message sent is:

```
MSGSET:0:161C:9794:
```

The response is:

```
161C 7067
```

In this case “7067” is the checksum

### 14.4 The GET Command

The GET command retrieves settings data from the sensor, including message format data and user alarm settings amongst others. This command does not retrieve visibility or environmental information from the sensor. To retrieve visibility data refer to the POLL command.

#### The GET request

<table>
<thead>
<tr>

<td>Carriage return</td>
</tr>
<tr>
<td>0x0A</td>
<td>Line feed</td>
</tr>
</tbody>
</table>

<sup>1</sup> These values are shown in hexadecimal format not ASCII.
Example of a GET returned data

```
0 0 0 10000 0 0 10000 2 1009 M 30 0 2 1 1 0 0 0 1 11.5 80 D4FD
```

Explanation:

- Sensor ID = 0
- User Alarm 1 not set
- User Alarm 1 not active
- User Alarm 1 distance = 10000 metres
- User Alarm 2 not set
- User Alarm 2 not active
- User Alarm 2 distance = 10000 metres
- Serial baud rate 2 (=38400Bd)
- Serial number = 1009
- Visibility Units = M
- Continuous mode output interval = 30 seconds
- Polling mode = 0 (continuous mode)
- Message format = 2 (full message)
- RS232 or RS485 serial communications = 1 (RS485)
- Averaging period = 1 minute
- Sample timing = 1 sample per second
- Dew heater override = 0 (sensor will automatically control the dew heaters)
- Hood heater override = 0 (sensor will automatically control the hood heaters)
- Dirty window compensation = 0 (dirty window compensation off)
- CRC checking on received commands = 1 (CRC checking enabled)
- Sensor power down voltage = 11.5V
- Relative humidity threshold 80 (CS125 only)
- Checksum = D4FD
14.5 The MSGGET command

The Message Get (MSGGET) command retrieves the current settings of the custom message from the sensor.

<table>
<thead>
<tr>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x01(Hex)</td>

<tr>
<td>0x04(Hex)</td>
<td>EOT</td>
</tr>
</tbody>
</table>

Example of the MSGGET command as sent to the sensor

The message sent is:

```
MSGGET:0:0:C6ED:
```

The response is:

```
161C 7067
```
14.6 The POLL command – Polling the sensor

The POLL command requests the current visibility and/or alarm conditions from the sensor. The output format of this command depends on how the sensor is configured using the SET command or the menu interfaces.

The POLL request

<table>
<thead>
<tr>
<th>POLL transmitted data</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x02[^B]</td>
<td>STX, “B”</td>
</tr>
<tr>
<td>POLL</td>
<td>Delimiting character</td>
</tr>
<tr>
<td>:</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>Address based on Sensor ID</td>
</tr>
<tr>
<td>:</td>
<td>Delimiting character</td>
</tr>
<tr>
<td>0</td>
<td>Reserved for future use, zero default</td>
</tr>
<tr>
<td>:</td>
<td>Delimiting character</td>
</tr>
<tr>
<td>XXXX</td>
<td>Checksum[^C]</td>
</tr>
<tr>
<td>:</td>
<td>Delimiting character</td>
</tr>
<tr>
<td>0x03[^C]</td>
<td>ETX, “C”</td>
</tr>
<tr>
<td>0x0D[^C]</td>
<td>Carriage return</td>
</tr>
<tr>
<td>0x0A</td>
<td>Line feed</td>
</tr>
</tbody>
</table>

(1) These values are shown in hexadecimal format not ASCII.
(2) As entered on a keypad.
(3) Not case sensitive.

Example of a POLL request

POLL:0:0:XXXX:

NOTE

The maximum response time to a poll command is 100 ms.

If the setting to check the checksum on received commands is enabled the checksum varies with the Sensor ID value.

15. Entering the sensor menu system

The user can enter the menu system by typing ‘open id’ into their terminal program then pressing the return key on their keyboard. The id corresponds to the sensor ID number. The Sensor ID number can be in the range of 0 to 9. The factory default is 0.

NOTE

The ‘open 0’ command is not normally echoed.
The terminal menu only gives access to more common settings.
The following text should now be displayed:

```
WELCOME TO THE CAMPBELL SCIENTIFIC LTD CS125 SETUP MENU
ID 0
S/N 2003
(1) Message output menu
(2) User alarm menu
(3) Calibrate sensor
(4) System information
(5) Communications setup
(6) System configuration

(9) Exit and save
(0) Exit and don't save
```

The displayed options are accessed simply by typing the corresponding number then pressing return. No changes will take effect until you ‘Exit and Save’. The exception to this is the calibration menu, but you will be informed before any changes are made.

Typing ‘1’ opens the message menu containing settings relating to the sensor’s outputs.

**Menu 1: The message output menu**

```
CS125 MESSAGE - MENU 1
ID 0
S/N 1006
(1) Set message format: FULL SYNOP
(2) Toggle units: METRES
(3) Toggle polled or continuous mode: CONTINUOUS
(4) Set continuous mode message-interval: 60 second(s)
(5) Toggle output averaging period: 1 minute(s)
(6) Sampling interval: 1 second(s)

(9) Refresh
(0) Return to main menu
```
Typing ‘1’ allows the message format to be set. The options are listed as shown below and typing the appropriate number sets the required message format. The messages are described in more detail in Section 11.

The CS120A can only output messages 0-2 and a limited custom message.

```
CS125 MESSAGE - SUB 3
Set the message output format. Current format is: FULL SYNOP
   - Basic        = 0
   - Partial      = 1
   - Full         = 2
   - Basic SYNOP  = 3
   - Partial SYNOP= 4
   - Full SYNOP   = 5
   - Basic METAR  = 6
   - Partial METAR= 7
   - Full METAR   = 8
   - Generic Basic SYNOP = 9
   - Generic Partial SYNOP= 10
   - Generic Full SYNOP  = 11
   - Custom output   = 12
->
```

For example, typing ‘2’ will toggle the units through the options ‘METRES’ and ‘FEET’ and typing ‘4’ will allow the message interval to be entered.

Option (2) allows the User Alarms to be set, again by toggling through options or changing values.

**Menu 2: The user alarm menu**

```
CS125 ALARM - MENU 2
ID 0
S/N 1009
(1) Toggle user alarm one: DISABLED
(2) Toggle alarm one threshold: LESS THAN
(3) Set new user alarm one activation point: 10000 m
(4) Toggle user alarm two: DISABLED
(5) Toggle alarm two threshold: LESS THAN
(6) Set new user alarm two activation point: 10000 m
(9) Refresh
(0) Return to main menu
->
```
Menu 3: The calibration menu

<table>
<thead>
<tr>
<th>Menu 3: The calibration menu</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS125 CALIBRATION - MENU 3</td>
</tr>
<tr>
<td>ID 0</td>
</tr>
<tr>
<td>S/N 1003</td>
</tr>
<tr>
<td>(1) Perform calibration</td>
</tr>
<tr>
<td>(2) Restore the factory calibration</td>
</tr>
<tr>
<td>(3) Perform dirty windows zero offset calibration</td>
</tr>
<tr>
<td>(4) Restore dirty windows factory calibration</td>
</tr>
<tr>
<td>(9) Refresh</td>
</tr>
<tr>
<td>(0) Return to main menu</td>
</tr>
</tbody>
</table>

Consult the ‘calibration’ section of this manual for information on how to calibrate the sensor.

NOTE

Once a calibration is finished changes are immediate, but factory calibrations can be restored if needed using Option ‘(2)’ in the calibration menu. The disk constants however remain as the last disk used.

Option (4) gives the systems information menu containing useful information such as temperature and system alarms.
Menu 4: The system information menu

<table>

</tbody>
</table>

(8) Get debug
(9) Refresh
(0) Return to main menu

->

If either of the dirty window alarms are set it is recommended you follow the cleaning section of this manual (Section 18).

If there is a flash error or signature error it is recommended that you contact Campbell Scientific.

The sensor power down voltage shown before the supply voltage is not available for CS120A sensors with serial numbers less than E1030.
Menu 5: The communication menu

CS125 COMMUNICATIONS - MENU 5
ID 0
S/N 1009
(1) Set sensor ID
(2) Set RS232/RS485 baud rate: 38400
(3) Toggle RS232/RS485 modes: RS232
(9) Refresh
(0) Return to main menu
->

The communications menu is used to set baud rates and the mode of operation (RS232/RS485).

NOTE
No change will take effect until you `exit and save`.

Menu 6: Configuration

CS125 CONFIGURATION - MENU 6
ID 0
S/N 1003
(1) Dew heater override: AUTOMATIC
(2) Hood heater override: AUTOMATIC
(3) Dirty window compensation: NO COMPENSATION
(4) Command line CRC Checking: DO NOT CHECK
(5) Sensor power down voltage: 7.0V
(6) RH threshold: 80%
(9) Refresh
(0) Return to main menu
->

This menu sets dew and hood heaters to automatic or off, dirty window compensation and CRC checking. In addition it allows the sensor power down voltage to be set. If set this will put the sensor into a low power state (which will not make measurements) before the battery voltage has fallen low enough to damage a back-up battery. The RH threshold for a CS125 can also be set from this menu. This applies if a CS215 sensor is attached and defines the level of RH below which obscuration is deemed to be dry (that is haze, SYNOP 04 or 05, METAR HZ) rather than wet (mist, SYNOP 10, METAR BR or fog, SYNOP 30 etc. METAR FG).
Menu 9 and 0: Exiting the menu system

Options ‘9’ and ‘0’ exit from the menu system. Note that typing ‘0’ will lose all changes made including communications settings.

CAMPBELL SCIENTIFIC LTD sensor menu exited.

16. Calibrating the sensor

16.1 Visibility calibration

The sensor can be checked and adjusted using the optional sensor high grade calibration kit part number 28678. The calibration must be run using the onboard menu system. If you have Campbell Scientific’s Device configuration program a terminal emulation screen is provided in the sensor screens to let you access this function. To perform the calibration you will need a sensor calibrator disk and a computer with a standard serial port compatible with the sensor. If your sensor is not currently configured for RS232 communications you can set the internal switch, switch three, to temporarily set the sensor to RS232 mode 38400 bps. If the sensor is already set in RS232 mode it should not be necessary to change any internal switches. (See Section 10 for more information on the sensor internal switches.)

The test should ideally be performed in the following conditions:

- Ambient temperature should be between 0ºC and 50ºC
- The local visibility should be approximately 10,000 metres or higher.

The system is self-regulating. However, it is recommended that the sensor is calibrated at least every two years.

The calibration is performed from menu item 3 on the main terminal screen. Please refer to the menu section (Section 13) of this manual for further information on how to access this menu.

Once you have selected menu item 3 you should be presented with the following screen.

<table>
<thead>
<tr>
<th>CS125 CALIBRATION – MENU 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID 0</td>
</tr>
<tr>
<td>S/N 1006</td>
</tr>
<tr>
<td>(1) Perform calibration</td>
</tr>
<tr>
<td>(2) Restore the factory calibration</td>
</tr>
<tr>
<td>(3) Perform dirty windows zero offset calibration</td>
</tr>
<tr>
<td>(4) Restore dirty windows factory calibration</td>
</tr>
<tr>
<td>(9) Refresh</td>
</tr>
<tr>
<td>(0) Return to main menu</td>
</tr>
</tbody>
</table>
Select option 1 to start the calibration. You will then be asked to confirm that you would like to perform a calibration. Please note, once you have entered yes at this point you will not be able to exit until the test is complete. However, power cycling the unit at this point will have no adverse effect on the sensor.

Do you want to perform a calibration Y/N?

NOTE
At this stage it is advisable to clean the lenses. Refer to Section 18 ‘Cleaning’ for more information. A simple visual check may be enough to confirm the lenses are clean.

Once you have started the tests you will be asked for the sensor calibrator serial number and coefficient with a confirmation at each step giving you the chance to correct typing mistakes.

NOTE
When asked for confirmation you do not need to press return after you type ‘y’.

Starting calibration.
Input the sensor calibrator serial number ->E2002
Is E2002 correct? (Y/N)?
Input the sensor calibrator constant ->28.8
Is 28.8 correct? (Y/N)?

Place one calibration bung into each hood, then press any key.
When you have entered the calibrator information the sensor will wait for you to place the foam bungs into the sensor hoods. The bungs are designed to block all light from the outside reaching inside the head. Place one bung into each hood. If either of the bungs are damaged or appear to have any gaps around the edge please contact Campbell Scientific.

Starting dark level calibration.
This test will take approximately two minutes

This part of the test will take approximately two minutes. Every ten seconds a dot should appear indicating that the test is progressing as normal.

Dark level test complete. Please remove the bungs. Now place the sensor calibrator into the sampling volume. Press any key once this is done.

Remove the bungs once the sensor instructs you to. Place the sensor calibrator into the volume by fastening it to the central mounting point.
Starting light level calibration.
This test will take approximately two minutes.

This part of the test will take approximately two minutes. Every ten seconds a dot should appear indicating that the test is progressing as normal.

Calibration is now complete.
Saving user settings
Press any key to exit.

Once the second stage of the test has been completed the new calibration constants will be saved automatically. All calibration constants including both the user and the factory setting can be viewed from menu item 4 from the main menu once the test is completed.

16.2 Dirty window zero calibration

Option 3 in the calibration menu allows the user to reset the zero contamination level for dirty windows detection (option 4 allows a return to the factory value if something goes wrong with the calibration process.)

This should be carried out every two years to check for any slight drift in the dirty window detection.
To carry out the dirty window zero offset calibration make sure the windows are very clean. Temperature should ideally be in the range 15 – 30°C and the sensor should have been powered up for over 5 minutes.

Typing ‘3’ returns text similar to the following:

Current values EO=3200 DO=4649 DD=995
Cal DW offset? Y/N?

Then type ‘Y’. The sensor responds in a similar way to the following:

Calibrating dirty window system...Please wait

DD=990 DO=4535
DD=1000 DO=4531
DD=1010 DO=4373
DD=1020 DO=4206
DD=1030 DO=3886
DD=1110 DO=2675
DD=1120 DO=2682
DD=1130 DO=2530
DD=1140 DO=2392
EO=3230 ES=371 DO=2251 DS=234 DD=1140
Press any key to exit (Not return)

Press any key and the dirty window zero offset calibration is complete.

17. Performing an operating system update

Operating system updates for the sensor present weather sensor are performed using Campbell Scientifics Device Configuration Utility (DevConfig) software. Please refer to the help built into the DevConfig software for full instructions on how to update the sensor operating system. The pictures below show the procedure using DevConfig.

NOTE

To use DevConfig to carry out an OS change requires RS232 communication. However if a sensor is set to communicate by RS485 it is not necessary to change this in the sensor.

Connect a PC or laptop with DevConfig running to the sensor with RS232 communications. Run DevConfig to the stage shown in Figure 17.1. Then turn on the power supply. The update will then take place through RS232. The sensor will however remain in RS485 mode afterwards.
Figure 17-1. Sensor DevConfig download instructions

Figure 17-2. Sensor DevConfig screen when OS update is complete
18. Cleaning

The sensor is a robust instrument that will provide years of uninterrupted weather monitoring. Calibration is carried out at the factory and can be redone easily on site with the optional sensor calibrator or carried out by Campbell Scientific if required. Only general cleaning of the lenses is required to keep the sensor working efficiently.

Cleaning of the sensor will be required from time to time to ensure that the lenses are free from contaminants. The frequency of required cleaning depends on the exposure of the instrument to such contaminants. This will vary depending on the site location. The sensor is capable of self diagnosing dirty lenses and will indicate in its output when the lenses are contaminated to such a degree that its visibility measurements may be affected.

**NOTE**

A lower level of contamination than is detected by the dirty window alarms, can affect the visibility measurements. The sensor can be configured to attempt to make a correction for contamination although the accuracy of that correction depends on the ‘type of dirt’.

We suggest 6 monthly intervals for locations not prone to contaminants and monthly intervals for those prone to contamination (roadside or airport use). In some cases more frequent cleaning may be required where there are high levels of contaminants and high dependency on the instrument output.

**CAUTION**

If the lenses require cleaning, it is very important that only a proper lens cloth or lens tissue be used. The use of inappropriate materials to clean the lenses can permanently damage or reduce the effectiveness of the lenses leading to errors in measurement of precipitation and visibility.

It is advisable to use an air duster to blow any loose dust and dirt from the lenses as a first step. Using a lint free lens cloth or lens tissue impregnated with a small amount of isopropyl alcohol solvent clean the lens surface by dragging the cloth across the lens surface being careful not to apply excessive pressure.

Excessive pressure may lead to some types of contaminant scratching the lens surface. Over time such scratches can lead to reduced sensor accuracy.

**NOTE**

Spiders webs and certain ‘fluffy’ seeds which get lodged in the optical path can lead to the sensor permanently giving low readings as they can emulate precipitation. Cleaning the contamination away with a duster will return the sensor to normal operation.

If spiders are a persistent problem, using some carefully applied insecticide can deter them.
19. **Lubricating the enclosure screws**

The sensor enclosure screws should be lubricated with a suitable anti-seize grease (often copper loaded) to protect the threads from corrosion. This should be reapplied when resealing the enclosure at regular intervals, normally after replacing the desiccant. This is of particular importance if using the sensor in corrosive or salt laden atmospheres.

20. **Desiccant**

Two bags of desiccant are supplied. One is inside the enclosure, the other is separate and sealed in a plastic bag. Desiccant use depends on your application but for use in typical temperature conditions one bag is sufficient for a twelve month period. The desiccant should be placed inside the enclosure taking care that it is not trapped between the lid and the enclosure when the lid is replaced.

The second bag of desiccant should be kept in the plastic shipping bag as a replacement for when the initial bag needs to be dried out. The bags can be rotated in this way many times. Desiccant bags can be dried out by the following method:

1. Arrange the bags on a wire tray in a single layer to allow for adequate air flow around the bags during the drying process. The oven’s inside temperature should be room or ambient temperature (25°C - 30°C). A convection, circulating, forced air type oven is recommended for this regeneration process. Seal failures may occur if any other type of heating unit or appliance is used.

2. When placed in a forced air, circulating air, or convection oven, allow a minimum of 4 to 5 cm of air space between the top of the bags and the next metal tray above the bags. If placed in a radiating exposed infrared element type oven, shield the bags from direct exposure to the heating element, giving the closest bags a minimum of 40 cm clearance from the heat shield. Excessive surface film temperature due to infrared radiation will cause the Tyvek material to melt and/or the seals to fail. Seal failure may also occur if the temperature is allowed to increase rapidly. This is due to the fact that the water vapour is not given sufficient time to diffuse through the Tyvek material, thus creating internal pressure within the bag, resulting in a seal rupture. Temperature should not increase faster than 0.1°C to 0.3°C per minute.

3. Set the temperature of the oven to 118°C, and allow the bags of desiccant to reach equilibrium temperature.

**CAUTION**

Tyvek has a melting temperature of 121°C - 127°C.

(NON MIL-D-3464E activation or reactivation of both silica gel and Bentonite clay can be achieved at temperatures of 104°C).

4. Desiccant bags should be allowed to remain in the oven at the assigned temperature for 24 hours. At the end of this period, the bags should be immediately removed and placed in a desiccators jar or dry (0% relative humidity) air tight container for cooling. If this procedure is not followed precisely, any water vapour driven off during reactivation may be re-adsorbed during cooling and/or handling.
5. After the bags of desiccant have been allowed to cool in an airtight desiccator, they may be removed and placed in either an appropriate type polyliner tightly sealed to prevent moisture adsorption, or a container that prevents moisture from coming into contact with the regenerated desiccant. Some care should be taken when re-activating desiccant bags. If heated in an oven which is too hot, the bags may burst. If in any doubt, we recommend purchasing new desiccant packs instead of oven drying. Failure to use or exchange the desiccant may lead to condensation inside the enclosure. Not only will this lead to corrupted data but, in the long term, can also cause corrosion which is expensive to repair.
Appendix A. CS120A/CS125 block diagram

Block diagram

Detector hood
- Transimpedance amplifier
- Photo-detector
  - Amplifier
  - Dirty window detector
  - Hood heater
  - Dew heater
  - Detector internal temperature

3x interconnecting cables

Emitter hood
- 850nm Emitter
- Power level + Driver circuitry
  - Emitter power feedback
  - Amplifier
  - Dirty window detector
  - Hood temperature
  - Hood heater
  - Dew heater
  - Emitter internal temperature

3x interconnecting cables

Main DSP box
- On board voltage monitoring
- Second stage amplifiers and filters
- 14-bit Analogue to digital converter
- External temperature monitoring*
- SDI-12 interface for external CS215*
  - MCU (Micro controller unit)
    - Hood heater drive
    - Low noise PSU
    - Two 5V user alarm outputs
    - RS232 or RS485 serial communication

*CS125 only
Appendix B. Example C code of the CCITT CRC

The code below is provided as an example for programmers implementing their own code to communicate with the sensor. Users using Campbell loggers can use the Checksum command in CRBasic to generate a CCITT checksum. Command: Checksum/ChkSumString,1,0).

The checksum includes all characters excluding the SOT, EOT and the checksum itself.

The SET and SETNC commands also exclude the two delimiting ’:’ characters, one on each side of the checksum itself.

```c
// ---------------------------------------------------
// Creates a CCITT CRC16 checksum seeded with 0x0000 (XModem style) using a
// fast non table based algorithm.
// Pass in the data to convert into a CRC in the form of a NULL terminated
// character array (a string).
// Returns the CRC in the form of an unsigned 16 bit integer value
// Note: This algorithm has only been tested on a native 16-bit processor with
// a hardware barrel shifter
// All integers are 16-bits long
// ---------------------------------------------------
unsigned int CRC_CCITT(char LineOfData[]){
    unsigned int crc; // returned CRC value
    unsigned int i;   // counter
    crc = 0x0000;

    // create a check sum for the incoming data
    for(i=0; i < strlen(LineOfData); i++){
        unsigned crc_new = (unsigned char)(crc >> 8) | (crc << 8);
        crc_new ^= LineOfData[i];
        crc_new ^= (unsigned char)(crc_new & 0xff) >> 4;
        crc_new ^= crc_new << 12;
        crc_new ^= (crc_new & 0xff) << 5;
        crc = crc_new;
    }

    return(crc);
}
```

<td>83</td>
</tr>
<tr>
<td>Rain shower(s) or intermittent rain, violent</td>
<td>84</td>
</tr>
</tbody>
</table>
D2. METAR Codes produced by the CS125

The following METAR codes from WMO table 4678 can be output by the sensor.

<table>
<thead>
<tr>
<th>Weather Type</th>
<th>NWS Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>UP</td>
<td>Unidentified precipitation</td>
</tr>
<tr>
<td>HZ</td>
<td>Haze</td>
</tr>
<tr>
<td>BR</td>
<td>Mist</td>
</tr>
<tr>
<td>FG</td>
<td>Fog</td>
</tr>
<tr>
<td>DZ</td>
<td>Drizzle</td>
</tr>
<tr>
<td>RA</td>
<td>Rain</td>
</tr>
<tr>
<td>SG</td>
<td>Snow grains</td>
</tr>
<tr>
<td>SN</td>
<td>Snow</td>
</tr>
<tr>
<td>PL</td>
<td>Ice pellets</td>
</tr>
</tbody>
</table>

Notes:

HZ will only be reported if a CS215 is connected to allow relative humidity information to be available.

FZ (freezing) may be added as a descriptor in front of BR, FG, DZ and RZ.

Intensity qualifiers, ‘-’ for light, ‘+’ for heavy, may be added in front of DZ, RA, SN, and PL.

Combinations, for example RASN for rain and snow can be reported.

D3. NWS Codes produced by the CS125

NWS codes produced by the CS125 available in a custom message

<table>
<thead>
<tr>
<th>Weather Type</th>
<th>NWS Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drizzle</td>
<td>L</td>
</tr>
<tr>
<td>Rain</td>
<td>R</td>
</tr>
<tr>
<td>Snow</td>
<td>S</td>
</tr>
<tr>
<td>Snow grains</td>
<td>SG</td>
</tr>
</tbody>
</table>

Z (freezing) may be added as a descriptor in front of L and R

Intensity qualifiers, ‘-’ for light, ‘+’ for heavy, may be added after the NWS code.
