

WARRANTY AND ASSISTANCE

This equipment is warranted by CAMPBELL SCIENTIFIC (CANADA) CORP. ("CSC") to be free from defects in materials and workmanship under normal use and service for **twelve (12) months** from date of shipment unless specified otherwise. ****** **Batteries are not warranted.** ****** CSC's obligation under this warranty is limited to repairing or replacing (at CSC's option) defective products. The customer shall assume all costs of removing, reinstalling, and shipping defective products to CSC. CSC will return such products by surface carrier prepaid. This warranty shall not apply to any CSC products which have been subjected to modification, misuse, neglect, accidents of nature, or shipping damage. This warranty is in lieu of all other warranties, expressed or implied, including warranties of merchantability or fitness for a particular purpose. CSC is not liable for special, indirect, incidental, or consequential damages.

Products may not be returned without prior authorization. To obtain a Return Merchandise Authorization (RMA), contact CAMPBELL SCIENTIFIC (CANADA) CORP., at (780) 454-2505. An RMA number will be issued in order to facilitate Repair Personnel in identifying an instrument upon arrival. Please write this number clearly on the outside of the shipping container. Include description of symptoms and all pertinent details.

CAMPBELL SCIENTIFIC (CANADA) CORP. does not accept collect calls.

Non-warranty products returned for repair should be accompanied by a purchase order to cover repair costs.

14532 131 Avenue NW | Edmonton AB T5L 4X4 780.454.2505 | fax 780.454.2655 | campbellsci.ca

Assistance

Products may not be returned without prior authorization. The following contact information is for Canadian and international clients residing in countries served by Campbell Scientific (Canada) Corp. directly. Affiliate companies handle repairs for clients within their territories. Please visit www.campbellsci.ca to determine which Campbell Scientific company serves your country.

To obtain a Returned Materials Authorization (RMA), contact CAMPBELL SCIENTIFIC (CANADA) CORP., phone (780) 454-2505. After a measurement consultant determines the nature of the problem, an RMA number will be issued. Please write this number clearly on the outside of the shipping container. Campbell Scientific's shipping address is:

CAMPBELL SCIENTIFIC (CANADA) CORP.

RMA#____ 14532 131 Avenue NW Edmonton, Alberta T5L 4X4 Canada

For all returns, the client must fill out a "Statement of Product Cleanliness and Decontamination" form and comply with the requirements specified in it. The form is available from our web site at www.campbellsci.ca/repair. A completed form must be either emailed to repair@campbellsci.ca or faxed to (780) 454-2655. Campbell Scientific (Canada) Corp. is unable to process any returns until we receive this form. If the form is not received within three days of product receipt or is incomplete, the product will be returned to the client at the client's expense. Campbell Scientific (Canada) Corp.f reserves the right to refuse service on products that were exposed to contaminants that may cause health or safety concerns for our employees.

PLEASE READ FIRST

About this manual

Please note that this manual was originally produced by Campbell Scientific Inc. (CSI) primarily for the US market. Some spellings, weights and measures may reflect this origin.

Some useful conversion factors:

Area: $1 \text{ in}^2 \text{ (square inch)} = 645 \text{ mm}^2$

Length: 1 in. (inch) = 25.4 mm

1 ft (foot) = 304.8 mm 1 yard = 0.914 m

1 mile = 1.609 km

Mass: 1 oz. (ounce) = 28.35 g

1 lb (pound weight) = 0.454 kg

Pressure: 1 psi (lb/in2) = 68.95 mb **Volume:** 1 US gallon = 3.785 litres

In addition, part ordering numbers may vary. For example, the CABLE5CBL is a CSI part number and known as a FIN5COND at Campbell Scientific Canada (CSC). CSC Technical Support will be pleased to assist with any questions.

About sensor wiring

Please note that certain sensor configurations may require a user supplied jumper wire. It is recommended to review the sensor configuration requirements for your application and supply the jumper wire is necessary.

GPS16X-HVS GPS Receiver

1. Overview

FIGURE 1-1. The GPS16X-HVS terminates in pigtails for direct connection to our dataloggers

The GPS16X-HVS is a complete GPS receiver manufactured by Garmin International, Inc. Campbell Scientific configures the GPS16X-HVS to work with our dataloggers and modifies its cable so that the cable terminates in pigtails. The pigtails connect directly to the control ports of our dataloggers or with the aid of an A300.

The GPS16X-HVS includes the GPS receiver and antenna in the same housing with one cable for the power supply and communications. The GPS antenna must have a clear view of the sky. Generally the GPS antenna will not work indoors.

The GPS16X-HVS is a 12-channel GPS receiver that supports FAA Wide Area Augmentation System (WAAS) or RTCM differential GPS. Also supported is the 1 Pulse Per Second (PPS) timing signal. The cable connections provided with the GPS16X-HVS do not support differential GPS correction. The cable can be modified by the user if differential correction is required.

1.1 Default Settings

TABLE 1-1 shows the default settings of the GPSX16-HVS.

TABLE 1-1. Default Settings				
Baud Rate	38400 bps			
Parity	N (no parity)			
Stop Bit	1			
Sentences Output	GPGGA, GPRMC			
PPS	100 ms			

1.2 Compatible Dataloggers

Compatible Contemporary Dataloggers

CR200(X) Series	CR800/ CR850	CR1000	CR3000	CR6	CR9000X
	√ *	√ *	√ *	V	See Appendix B and C

^{*}If PPS is required, the A300 Power and Signal Converter is needed.

Compatible Retired Dataloggers

CR500	CR510	CR10	CR10X	21X	CR23X	CR9000	CR5000	CR7X
					See Appendix B and C			

Our CR6, CR800, CR850, CR1000, and CR3000 dataloggers typically use the CRBasic **GPS()** instruction to read the GPS16X-HVS. To use the PPS functionality, some dataloggers need an updated clock chip. The clock chip is factory replaced (requires an RMA). Dataloggers with the following serial numbers need an updated chip:

Datalogger	Serial Number
CR1000M	< 20409
CR800, CR850	< 7920
CR3000	< 3168

In August 2014, Garmin changed the GPS16X-HVS PPS output signal from 5 V to 3 V. Units with serial numbers greater than 1A4189318 have a 3 V PPS output signal. When this new design is used with a CR800, CR850, CR1000, or CR3000 datalogger, a 3 V to 5 V voltage shifter is required for use with the PPS signal output. The A300 can be used for this purpose. This level shifter is NOT required for the CR6 datalogger.

1.3 Common Accessories

CSI part number	Description
17212	GPS16X-HVS magnetic mount
CM235	Magnetic mounting stand
A200	Sensor to PC interface

2. Specifications

Physical

Size: 86 mm (3.39 in) diameter, 42 mm (1.65 in) high

Weight: 181 g (6.4 oz) without cable, 332 g (11.7 oz) with 5 m

cable

Cable: PVC-jacketed, 5 m, foil-shielded, 8-conductor, 28 AWG

Electrical Characteristics

Input Voltage: 8.0 Vdc to 40 Vdc unregulated

Current Drain: 65 mA @ 12 Vdc

GPS Receiver

Sensitivity: –185 dbW minimum

GPS Performance

Receiver: WAAS enabled; 12 parallel channel GPS receiver

continuously tracks and uses up to 12 satellites, 11 if

PPS is active

Acquisition Times (Approximate)

Reacquisition: Less than 2 s

Hot: 1 s (all data known)

Warm: ~38 s (initial position, time and almanac known,

ephemeris unknown)

Cold: $\sim 45 \text{ s}$

SkySearch: 5 min (no data known)

Sentence Rate: 1 s default; NMEA 0183 output interval configurable

from 1 to 900 s in one second increments

Accuracy: GPS Standard Positioning Service (SPS)

Position: Less than 15 m, 95% typical (100 m with selective

availability on)

Velocity: 0.1 knot RMS steady state

DGPS (USCG/RTCM)

Position: 3-5 m, 95% typical **Velocity:** 0.1 knot RMS steady state

DGPS (WAAS)

Position: Less than 3 m

Velocity: 0.1 knot RMS steady state

PPS Time: ± 1 microsecond at rising edge of PPS pulse (subject to

selective availability)

Dynamics: 999 knots velocity (limited above 60,000 ft, 6g

dynamics)

Interfaces: True RS-232 output, asynchronous serial input

compatible with RS-232 or TTL voltage levels, RS-232 polarity. Selectable baud rates (4800, 9600, 19200,

38400)

PPS: 1 Hz pulse, programmable width, 1 microsecond

accuracy

Power Control

Off: Open circuit

On: Ground or pull to low logic level < 0.3 volts

Environmental Characteristics

Temperature: -30 to 80 °C operational, -40 to 80 °C storage

3. Wiring

The GPS16X-HVS connects directly to a CR6, CR800, CR850, CR1000, or CR3000 datalogger (see TABLE 3-1). However, if PPS is required, the A300 Power and Signal Converter may be required for use with the CR800/850, CR1000, and CR3000. See Section 3.1, *Using with an A300 (p. 5)*. The CR6 does not require the use of an A300.

Refer to Appendix B.1, *CR23X Connections* (p. B-1), if connecting the receiver to a CR23X. Our CR5000 and CR9000X connect to the receiver via the SC110 and an SDM-SIO4 (see Appendix C, *Using an SDM-SIO4* (p. C-1)).

If the GPS16X-HVS is to be connected to a computer to change the default settings, an A200 or SC110 cable is needed (see Appendix A, *Changing GPS16X-HVS Settings (p. A-I)*).

FIGURE 3-1. CR1000 to GPS16X-HVS connection

3.1 Using with an A300

In 2014, Garmin changed the pulse-per-second (PPS) output of the GPS16X-HVS from 5 V to 3 V. Units with a serial number 1A4189318 or greater have a PPS output of 0 to 3 V. For those units, an A300 is needed to connect the PPS output to a CR800-series, CR1000, or CR3000 datalogger. Those dataloggers require the PPS line to have a voltage of 3.8 V or greater.

TABLE 3-2. GPS16X-HVS Wiring to A300 Terminals and Datalogger Terminals

4. GPS Data

The GPS16X-HVS has several data formats available. The GPS16X-HVS is configured to output the NMEA \$GPGGA and \$GPRMC time and position string. It is possible to configure the GPS16X-HVS to output other NMEA strings including the \$GPVTG track made good and ground speed string. See Appendix A, *Changing GPS16X-HVS Settings* (p. A-1), for details.

4.1 \$GPGGA Sentence (Position and Time)

Sample NMEA \$GPGGA data string:

\$GPGGA,hhmmss,llll.lll,a,nnnnn.nnn,b,t,uu,v.v,w.w,M,x.x,M,y.y,zzzz*hh<CR><LF>

TABLE 4-1. NMEA \$GPGGA String Definition			
Field	Description		
0	\$GPGGA	NMEA string identifier	
1	hhmmss	UTC of Position: Hours, minutes, seconds	
2	1111.111	Latitude: Degrees, minutes, thousandths of minutes	
3	a	N (North) or S (South)	
4	nnnnn.nnn	Longitude: Degrees, minutes, thousandths of minutes	
5	b	E (East) or W (West)	
6	t	GPS Quality Indicator: 0 = No GPS, 1 = GPS, 2 = DGPS	
7	uu	Number of Satellites in Use	
8	v.v	Horizontal Dilution of Precision (HDOP)	
9	W.W	Antenna Altitude in Meters	
10	M	M = Meters	
11	X.X	Geoidal Separation in Meters	
12	M	M = Meters. Geoidal separation is the difference between the WGS-84 earth ellipsoid and mean-sealevel.	
13	у.у	Age of Differential GPS Data. Time in seconds since the last Type 1 or 9 Update	
14	ZZZZ	Differential Reference Station ID (0000 to 1023)	
15	*	Asterisk, generally used as the termination character	
16	hh	Checksum	
17	<cr><lf></lf></cr>	Carriage return, line feed characters.	

Sample \$GPGGA output strings:

Cold Start

No satellites acquired, Real Time Clock and Almanac invalid: \$GPGGA,,,,,0,00,,,,,*66

Warm Start

No satellites acquired, time from Real Time Clock, almanac valid: \$GPGGA,235032.0,,,,0,00,,,,,*7D

Warm Start

One satellite in use, time from GPS Real Time Clock (not GPS), no position: \$GPGGA,183806.0,,,,0,01,,,,,*7D

Valid GPS Fix

Three satellites acquired, time and position valid: \$GPGGA,005322.0,4147.603,N,11150.978,W,1,03,11.9,00016,M,-016,M,,*6E

4.2 \$GPRMC Sentence (Position and Time)

Example (signal not acquired):

\$GPRMC,235947.000,V,0000.0000,N,00000.0000,E,,,041299,,*1D Example (signal acquired):

\$GPRMC,092204.999,A,4250.5589,S,14718.5084,E,0.00,89.68,211200,,*25

Field	Example	Comments	
Sentence ID	\$GPRMC		
UTC Time	092204.999	hhmmss.sss	
Status	A	A = Valid, V = Invalid	
Latitude	4250.5589	ddmm.mmmm	
N/S Indicator	S	N = North, S = South	
Longitude	14718.5084	dddmm.mmmm	
E/W Indicator	E	E = East, W = West	
Speed over ground	0.00	Knots	
Course over ground	0.00	Degrees	
UTC Date	211200	DDMMYY	
Magnetic variation		Degrees	
Magnetic variation		E = East, W = West	
Checksum	*25		
Terminator	CR/LF		

5. CRBasic Programming

This section describes programming a CR6, CR800, CR850, CR1000, or CR3000. See Appendix B, *CR23X Wiring and Programming (p. B-1)*, and Appendix C, *Using an SDM-SIO4 (p. C-1)*, for programming other dataloggers.

CRBasic is used to write programs for the CR6, CR1000, CR3000, CR800, and CR850 dataloggers. These dataloggers use several instructions to read GPS output, which is asynchronous serial data.

5.1 GPS() Instruction

The **GPS()** instruction is available for our CR6, CR800, CR850, CR1000, and CR3000 dataloggers. It is used along with a GPS device to set the datalogger's clock. This instruction will also provide information such as location (latitude/longitude) and speed, and store NMEA sentences from the GPS device.

NOTE

To use the **GPS()** instruction, the datalogger operating system (OS) should be OS17 or higher for the CR1000; OS10 or higher for the CR3000; or OS08 or higher for the CR800 and CR850. Go to *www.campbellsci.com/downloads* to upgrade the datalogger OS.

The resolution of accuracy for the clock set is 10 microseconds if the datalogger has a hardware revision number greater than 007 (RevBoard field in the datalogger's Status table). Otherwise, resolution is 10 milliseconds. The clock set relies on information from the GPRMC sentence. If this sentence is not returned, a clock set will not occur.

By default, the instruction expects the GPS unit to be set up at 38400 baud, outputting the GPRMC and GPGGA sentences once per second. The datalogger expects the start of the second to coincide with the rising edge of the PPS signal. If there is no PPS signal or if the required sentences come out at less than once per second, the datalogger will not update its clock.

GPS units with lower baud rates can be used with the GPS() instruction but the baud rate has to be set for the relevant Com port it is to be connected to either in the datalogger settings or by including a SetStatus() command after the BeginProg() instruction in the program (e.g., SetStatus("BaudrateCOM4",19200)).

Baud rates of 2400 bps or lower will not work as the GPS unit will not transmit the two GPS sentences once per second reliably. Similar problems can be encountered even at higher baud rates if too many optional GPS strings are selected to be output.

The **GPS()** instruction has the following syntax:

GPS(GPSArray, ComPort, TimeOffset, MaxTimeDiff, NMEAStrings)

Description of the parameters follows:

GPSArray

The *GPSArray* parameter is the variable in which to store the information returned by the GPS. Fifteen values are returned. If this array is not dimensioned to 15, values will be stored to fill the array and no error will be returned. If no values are available, NAN will be returned. The following values are returned by the GPS:

Array(1) = Latitude, degrees

Array(2) = Latitude, minutes

Array(3) = Longitude, degrees

Array(4) = Longitude, minutes

Array(5) = Speed over ground, knots

Array(6) = Course over ground, degrees

Array(7) = Magnetic variation (positive = East, negative = West)

Array(8) = Fix Quality (0 = invalid, 1 = GPS, 2 = differential

GPS, 6 = estimated)

Array(9) = Number of Satellites

Array(10) = Altitude, meters

Array(11) = Pulse per second (PPS) length, microseconds

Array(12) = Seconds since last GPRMC sentence

Array(13) = GPS Ready, 10 = ready

Array(14) = Maximum clock change, milliseconds (10 msec resolution)

Array(15) = Clock change count

ComPort

The *ComPort* parameter is the control port pair to which the GPS device is attached. Valid options are COM1 (C1/C2), COM2 (C3/C4), COM3 (C5/C6), and COM4 (C7/C8). Rx is used to read in the NMEA sentences and Tx is used to monitor the PPS from the GPS. This instruction defaults to a baud rate of 38,400 bps. If a different baud rate is required, use the **SetStatus()** instruction to override the default.

Time Off set

The *TimeOffset* parameter is the local time offset, in seconds, from UTC.

MaxTimeDiff

The *MaxTimeDiff* parameter is the maximum difference in time between the datalogger clock and the GPS clock that will be tolerated before the clock is changed. If a negative value is entered, the clock will not be changed.

For dataloggers prior to hardware revision 08, the *MaxTimeDiff* parameter should not be set to 0. A minimum value of 20 ms is recommended. With this hardware, when a **GPS()** instruction is in the program the clock is checked each second (regardless of how often the **GPS()** instruction is run). The clock is set if any difference is found. This can result in the clock being set each second, resulting in skipped records in the data table(s). This restriction does not apply to hardware revisions 08 or greater.

NMEAStrings The NMEAStrings parameter is the string array that holds the NMEA sentences. If it exists, the GPRMC sentence will reside in NMEAStrings(1), and the GPGGA sentence will reside in NMEAStrings(2). Any other sentences will reside in subsequent indexes into the array (on a first-in basis). Once an index in the array is used to store a particular sentence, that sentence will always be stored in that location when updates to the sentence are received.

5.2 **Example Program Using GPS() Instruction**

The following wiring and short program provide an example of using the GPS() instruction with the Garmin GPS16X-HVS.

```
'Program the GPS16-HVS to use 38.4 kbaud, no parity, 8 data bits, and 1 stop bit
PipeLineMode
                                        'Local time offset relative to UTC time
Const LOCAL TIME OFFSET = -6
Dim nmea_sentence(2) As String * 90
Public gps_data(15)
Alias gps_data(1) = latitude_a
                                         'Degrees latitude (+ = North; - = South)
Alias qps_data(2) = latitude_b
                                         'Minutes latitude
Alias gps_data(3) = longitude_a
                                         'Degress longitude (+ = East; - = West)
Alias gps_data(4) = longitude_b
                                        'Minutes longitude
Alias gps_data(5) = speed
                                        'Speed
Alias gps_data(6) = course
                                         'Course over ground
Alias gps_data(7) = magnetic_variation
                                        'Magnetic variation from true north (+ =
                                         'East; - = West)
                                         'GPS fix quality: 0 = invalid, 1 = GPS, 2 =
Alias gps_data(8) = fix_quality
                                        'differential GPS, 6 = estimated
                                         'Number of satellites used for fix
Alias qps_data(9) = nmbr_satellites
Alias gps_data(10) = altitude
                                         'Antenna altitude
                                         'usec into sec of system clock when PPS
Alias qps_data(11) = pps
                                         'rising edge occurs, typically 990,000 once
                                         'svnced
                                         'Time since last GPRMC string, normally less
Alias gps_data(12) = dt_since_gprmc
                                         than 1 second
Alias gps_data(13) = gps_ready
                                         'Counts from 0 to 10, 10 = ready
Alias gps_data(14) = max_clock_change
                                         'Maximum value the clock was changed in msec
Alias gps_data(15) = nmbr_clock_change
                                        'Number of times the clock was changed

5.3 Example Program Using Serial Instruction

Serial programming allows the retrieval of all values of GPRMC and GPGGA values. The GPS() instruction is a subset of the values that are available.

6. Troubleshooting

Testing and evaluation of serial communications is best done by reducing the whole system to small manageable systems. Usually some portions of the whole system are working. The first steps involve finding what is working. During this process you may find parts of the system that are not working or mistakes that can be easily corrected. Fix each subsystem before testing others.

6.1 Testing and Evaluating Serial Communications

Test the GPS16X-HVS for proper operation including the baud rate and output string. Use a computer, terminal emulator software, a serial port (RS-232), and a 9-pin to pigtail cable (SC110/sockets). The computer and serial port can be the same as used to communicate with the datalogger. Terminal emulation software is common. Hyperterm is supplied as part of WindowsTM and works. ProcommTM is another communication software package that works well.

Set up the software for the correct serial port, 38.4 kbps, 8 data bits, 1 stop bit and no parity. Flow control should be none. Using the SC110 cable, connect the GPS16X-HVS to the computer serial port. Power up the GPS16X-HVS. The GPS antenna should have a clear view of the sky. Don't expect the GPS antenna to work indoors. The \$GPGGA and GPRMC strings should be displayed once a second. Make sure the \$GPGGA string is showing a valid GPS fix. A valid GPS fix will display time, position and have a GPS quality number greater than zero.

SC110 Cable Connections				
GPS16X Receiver SC110/Sockets or DB9/Sockets to Pigtails				
White	Pin 2			
Black and Yellow Pin 5 (shares power ground)				

6.2 NMEAStrings Variable Populated, but Clock Not Setting

Look at the GPSReady variable. It will increment from 0 to 10 when the datalogger has received good GPRMC strings and a synchronized PPS signal. Once GPSReady reaches 10, the datalogger will begin to use GPS time for clock setting. The 12th value populated in GPSArray indicates elapsed time since a GPRMC string was received and should not exceed 1. If the GPRMC string is being received and GPSReady remains at zero, the PPS signal is not being received by the datalogger.

Appendix A. Changing GPS16X-HVS Settings

As configured by Campbell Scientific, the GPS16X-HVS will output the NMEA 0183 \$GPGGA and \$GPRMC data strings once a second, the PPS signal is enabled with a duration of 100 milliseconds and the baud rate is set to 38,400 baud.

Special software (SNRSRCFG.EXE) is available from Garmin International for system setup. The GPS16X-HVS user manual available from Garmin International provides technical details beyond the scope of the Campbell Scientific user manual.

Settings used by Campbell Scientific for GPS16X-HVS setup:

GPS Base Model = GPS 16(X)

Fix Mode = Automatic

Baud Rate = 38,400

Dead Reckon Time = 30 sec

NMEA output time = 1 sec

Position pinning = off

NMEA 2.30 mode = off

Power Save Mode = off (Normal mode)

PPS mode = 1 Hz

PPS Length = 100 mS

Phaze output Data = off

DGPS Mode = WAAS only

Differential mode = Automatic

Earth Datum Index = WGS 84

Selected Sentences = GPGGA and GPRMC

Common changes would be baud rate and selected sentences. The NMEA 0183 GPVTG data sentence gives ground speed and direction, which may be required for some applications. Changes can be made with the Garmin software, or with a terminal emulator and the Garmin technical user manual. Contact Garmin International (www.garmin.com) for either resource.

A.1 Computer Connections

Either an A200 interface or SC110 cable is required to connect the GPS16X-HVS to a computer. The A200 is used to connect to a computer USB port, and the SC110 is used to connect to a computer 9-pin serial port.

A.1.1 Using the A200

A.1.1.1 Driver Installation

If the A200 has not been previously plugged into your PC and your PC operating system is not Windows 7, the A200 driver needs to be loaded onto your PC.

NOTE

Drivers should be loaded before plugging the A200 into the PC. The A200 drivers can be downloaded, at no charge, from: www.campbellsci.com/downloads.

A.1.1.2 Wiring

One end of the A200 has a terminal block while the other end has a type B female USB port. The terminal block provides 12V, G, TX, and RX terminals for connecting the GPS16X-HVS (see FIGURE A-1 and TABLE A-1).

A data cable, CSI part number 17648, ships with the A200. This cable has a USB type-A male connector that attaches to a PC's USB port, and a type B male connector that attaches to the A200's USB port.

TABLE A-1. A200 Wiring				
Color	Sensor Cable Label	A200 Terminal		
Red	12V	+12Vdc		
Black	G	G		
Yellow	G	G		
White	Rx	Rx		
Gray	Tx	Tx		
Blue	sig ground	G		
Shield	sig ground	G		

FIGURE A-1. A200 Sensor-to-PC Interface

A.1.1.3 Powering the Sensor

The A200 provides power to the GPS16X-HVS when it is connected to a PC's USB port. An internal DC/DC converter boosts the 5 Vdc supply from the USB connection to a 12 Vdc output that is required to power the sensor.

A.1.1.4 Determining which COM Port the A200 has been Assigned

When the A200 is loaded, the A200 is assigned a COM port number. Often, the assigned COM port will be the next port number that is free. However, if other devices have been installed in the past (some of which may no longer be plugged in), the A200 may be assigned a higher COM port number.

Often, the assigned COM port will be the next port number that is free. However, if other devices have been installed in the past (some of which may no longer be plugged in), the A200 may be assigned a higher COM port number. To check which COM port has been assigned to the A200, you can monitor the appearance of a new COM port in the list of COM ports offered in your software package (e.g., *LoggerNet*) before and after the installation, or look in the Windows Device Manager list under the ports section (access via the control panel).

A.1.2 Using the SC110

The SC110 consists of two cables—each has a 2-foot (0.6 m) length. Use the cable that has a 9-pin female connector (DCE). TABLE A-2 shows wiring.

TABLE A-2. SC110's DCE Cable Wiring					
Wire Color of SC110's DCE Cable	Wire Color of GPS16X-HVS	Power Supply			
Brown	Blue	N/A			
White	White	N/A			
Yellow	Shield	N/A			
N/A	Red	+12 V			
N/A	Black	Ground			
N/A	Yellow	Ground			

Appendix B. CR23X Wiring and Programming

B.1 CR23X Connections

Reconfigure the receiver for 1200 baud using Garmin configuration software available on Garmin's website. Refer to TABLE B-1 to connect the GPS16X-HVS directly to a CR23X datalogger.

TABLE B-1. CR23X Wiring				
GPS16X-HVS	CR23X	Function		
Red	12V	Power In		
Black	Ground	Power Ground		
Yellow	Ground	Power Switch		
White	Control Port	TXD		
Gray	Control Port	PPS		
Blue	Ground in operation Send data to receiver for configuration	R _x data		
Shield	Ground	Shield		

B.2 Programming

Program instruction 15 (P15) is used to read the NMEA \$GPGGA string of time and position data. Each iteration of P15 can either read the numeric fields or read everything. When reading the numeric fields, such as time, latitude, longitude and elevation, P15 requires non-numeric delimiters between data points. The only available format of GPS data with delimiters is the NMEA 0183 format. Program instruction 15 (P15) reads serial data and discards non-numeric values. All non-numeric values act as delimiters between numbers, and decimal points can also act as delimiters. P15 can be used to import everything in the string, character by character, and convert it to the decimal equivalent. The decimal equivalent method is seldom used, and only when the general area (hemisphere) is not known.

B.2.1 Program Execution Interval

When the PPS signal is used to trigger the read data function (P15), the program table execution interval does not matter. Otherwise the timing between the GPS16X-HVS output and the datalogger read must be considered. Generally the execution interval can not be less than 2 seconds when the PPS signal is not used.

B.2.2 Reading GPS Data

TABLE B-2 is a sample CR23X P15 instruction for reading NMEA \$GPGGA data string. The second parameter has two dashes indicating data buffering has been turned off. The CR10X does not have the data buffering option.

TABLE B-2. P15 for NMEA \$GPGGA Data String				
Parameter	Data	Description		
1	1	Repetitions		
2	66	Configuration code for RS232 ASCII data at 38400 baud with data buffering turned off. The indicates data buffering turned off. Decimal delimiter		
3	1	Delay before sending data out		
4	05	Control ports. Two digit format AB. A is for handshaking and set to zero. B in this example is control port 5 (datalogger RCV). GPS16X-HVS communication cable: GPS transmit to control port 5 in this example		
5	1	Input location where first character to transmit is stored. Note: nothing is actually transmitted		
6	0	Number of consecutive input locations to send		
7	42	Termination character, 42 is ASCII equivalent of the asterisk		
8	100	Maximum number of characters to receive.		
9	80	Delay in mS. How long to wait for \$GPGGA string		
10	1	Starting input location for time and position data		
11	1	Multiplier, always 1.		
12	0	Offset, always 0.		

P15 parameters 4, 5, and 10 are somewhat variable. When using a CR23X, parameter 4 can be set to 05, 06 or 07 depending on what control ports are used. Wiring of the communication cable depends on the selection for parameter 4. With a CR23X the GPS transmit wire is connected to the control port selected in parameter 4.

P15 is executed when the PPS signal drives control port 8 high. P15 will wait until one of three conditions is met: the time-out listed in parameter 9 has expired, the maximum number of characters in parameter 8 have been read, or the termination character listed in parameter 7 has been read.

P15 parameter 10 is the first input location you wish to store GPS data in. Fifteen sequential input locations will be used to store time and position.

B.2.2.1 CR23X Example of Instruction 15 (P15)

Port S	Serial I/O (P1:	5)
1:	1	Reps
2:	66	RS-232 ASCII (decimal delimiter), 38400 Baud
3:	1	Delay (units = 0.01 sec)
4:	5	Control Ports
5:	1	Output Loc [Bulk]
6:	0	No. of Locs to Send
7:	42	Termination Character
8:	100	Maximum Characters
9:	80	Time Out Delay (units = 0.01 sec)
10:	1	Loc [Raw_time1]
11:	1	Mult
12:	0	Offset

NOTE Communication cable wiring for:

CR23X/Example B.2.2.1 — PPS to C8, GPS transmit to C5.

B.2.3 Filters

Filters can be used to make sure P15 reads the correct data string. Filters also ensure P15 starts to read the string at the beginning of the string. To use a filter, follow P15 with instruction P63 (extended parameters). P63 is used to define the filter. Enter the desired filter in P63.

TABLE B-3. Filter			
ASCII Equivalent	Character		
36	\$		
71	G		
80	P		
71	G		
71	G		
65	A		

B.2.4 Managing the Data

Several of the data values in the \$GPGGA string are too large to view or write to final storage. Some simple math is used to parse the data.

The UTC time is in the format hhmmss where hh is the hours, mm is the minutes and ss is the seconds. Six digits are too many to view with the datalogger display and some software. Add 0.3 to the raw time field. Multiply the raw time input location by 0.01 to reduce the magnitude and place the seconds in the fractional portion of the number. Next use P45 to write the integer portion (hours/minutes) to a new input location, then use P44 to write the fractional portion to another input location (seconds) and multiply that

location by 100. The last step is to use P45 again to take the integer portion of the input location for seconds. The result is hour/minutes in one input location and seconds in another.

The latitude and longitude can be parsed with the P15 instruction when decimal delimiter is on. If P15, parameter 2 is 6x, where the x selects the baud rate, every non-numeric value and decimal point will act as a delimiter. The Degrees and Minutes will be placed in one input location, and the minute fractional portion will be placed in the next input location. The decimal delimiter preserves the resolution of the original measurement.

Further parsing of the latitude and longitude may be necessary. Longitude degrees and minutes can range in value up to 18059, which exceeds the low resolution format of the dataloggers final storage area. Either parse the latitude and longitude degrees and minutes the same way the time was parsed, or store the data in high-resolution format.

The GPS quality number can be used to determine if you have a valid GPS fix and if the datalogger received the data properly. Use P89 to test if the GPS quality number is greater than or equal to one. There is a catch to using the GPS quality number to verify your data. P15 will write to fifteen input locations if everything works correctly. If P15 fails to read the GPS data, only the first input location is written to. The GPS quality number will be unchanged. If P15 fails to read the GPS data, the value displayed in the first input location will be 99999. The datalogger actually stores FFFFFFFh, a very large number. The time field includes six digits, which can be greater than 99999. This limits the usefulness of the time field as a test for a valid GPS fix. A better approach is to overwrite the GPS quality location with zero before executing P15. Use P30 to overwrite one input location.

If the GPS time is used to set the datalogger clock, the GPS time must be parsed into three input locations: Hour, Minutes, Seconds. P114 is used to set the datalogger clock to match values in input locations. Some time will have passed between the GPS fix and when the program table reaches the P114 instruction. Adjustments can be made by adding a second or two. Be careful about setting seconds to a number greater than 59. You can also correct the UTC time to local time. Table based dataloggers require year, day, hour, minute, and seconds to use P114. Only hour, minutes, and seconds are available from the \$GPGGA string. The PGRFM string includes the month, day and year, but is difficult to use.

B.2.5 Program Discussion

Wiring when using Instruction 15:

Function	Color	Datalogger Connection
Power in	Red	12 volts
Power ground	Black	Ground
Power switch	Yellow	ground
TXD	White	C5
PPS	Gray	C8
Ground	Blue	R _x data for reconfig
Shield	Shield	Ground

The GPS16X-HVS needs to be reconfigured using the Garmin configuration software from the Garmin website for 1200 baud, 8 data bits, 1 stop bit and no parity (see Appendix A, *Changing GPS16X-HVS Settings (p. A-1)*). The GPGGA string should be output. The 1 pulse per second signal should be output with a pulse duration of 100 milliseconds.

The code required to read the GPS information and store it to final storage is in Subroutine 98. Subroutine 98 is interrupt driven and triggered when a rising edge is detected on Control port 8. The GPS16X-HVS has a 1 PPS signal which is wired to control port 8. The transmit data line of serial port 1 on the GPS16X-HVS is wired to control port 5. The GPS16X-HVS serial port 2 generally is not used.

When the 1 PPS signal triggers subroutine 98, P15 is executed. P15 is setup to read ASCII serial data. Each data point is separated by a non-numeric character or a decimal point. Fifteen input locations are used as temporary storage for the \$GPGGA string. TABLE 4-1 explains the \$GPGGA string.

The input locations used for the \$GPGGA string are:

- 1) Raw Time, Time in hours, minutes, and seconds
- 2) LatDegMin, Latitude degrees and minutes
- 3) Lat Frac, Latitude fractions of minute
- 4) LngDegMin, Longitude degrees and minutes
- 5) Lng Frac, Longitude fractions of minute
- 6) Quality, GPS quality indicator
- 7) NumSats, Number of satellites in use
- 8) HDPWhole, Horizontal Dilution of Precision
- 9) HDPFrac, Horizontal Dilution of Precision, tenths
- 10) Elevation, Elevation in meters
- 11) Geoidal, Geoidal separation in meters
- 12) Geoidalth, Geoidal separation in meters, tenths
- 13) Age, Age of differential GPS data
- 14) Agetenth, Age of differential GPS data, tenths
- 15) DiffID, Differential reference station ID

Additional input locations used in the example program are:

- 18) Orig TM, Copy of original time
- 19) Int1, Place holder for math
- 20) Hours, formatted hours
- 21) Minutes, formatted minutes
- 22) Seconds, formatted seconds
- 23) remainder, place holder for math

Before writing any datalogger code, it's best to enter all the input locations needed. In Edlog, open the input location editor (F5) and enter names for the input locations listed above. When an input location is needed, use the input location pick list (F6).

B.3 Troubleshooting

The first step is to verify the GPS16X outputs with a terminal program (see Section 6.1, *Testing and Evaluating Serial Communications* (p. 13)). The second step is to verify that it really does not work. With the GPS16X-HVS running and the datalogger program running, look at the input location for GPS Quality Number. This location will show a one when the GPS16X-HVS output is picked up by the datalogger. The input location for parsed time and position are good locations to check. The location for seconds should update every time the GPS data is updated.

If the GPS time and position data are not shown in the input locations, check the communication cable wiring.

If the GPS16X-HVS data is not correct every program table execution but correct sometimes, check the P15 time-out. It may need a longer time-out. Also check the P15 maximum number of characters to receive, usually 100 is enough. Check the P15 termination character; it should be set to 42 (*). The termination character should also work if set to 13 or 10. Also check the buffering and filter. Buffering should be turned off by indexing parameter 2.

For P15 to properly read the \$GPGGA string, P15 must be executing while the \$GPGGA string starts and finishes. The P15 time-out needs to be long enough to pick up the string. The string is output once a second. If P15 starts to execute while the GPS16X-HVS is sending the string, P15 must wait until the string is sent again plus the amount of time it takes to send the string. It shouldn't need more than 1.5 seconds. P15 time-out is in units of 0.01 seconds, 100 = 1 second. A longer time-out will force the datalogger to wait until the time-out has expired or the termination character is received or the

maximum number of characters are received. If the data in input locations seem to move from the proper input location to another input location, P15 is stopping before the entire string has been read. An example is latitude being displayed in the time field, then in the latitude field. P15 works best when P15 quits reading data because the termination character has been read. Using the PPS to trigger subroutine 98 is the best way to start P15 just before the GPS16X-HVS sends the \$GPGGA string. If the PPS signal pulls C8 high while the datalogger is in the middle of executing an instruction, it may not be able to run subroutine 98 before the \$GPGGA string has started, which will cause the datalogger to miss the data string. Turning on the data buffering may remedy the problem. Lengthening the serial time-out to allow P15 to execute for 2 cycles of NMEA output may help. Otherwise the SDM-SIO4 may be required or the datalogger program will need to be simplified.

The datalogger will not pick up valid data until the GPS16X-HVS has a valid GPS fix, except during a GPS16X-HVS warm start where time can be read before position is known. Don't spend a lot of time trouble shooting a phantom problem just because the GPS receiver does not have a valid GPS fix.

Appendix C. Using an SDM-SIO4

C.1 SDM-SIO4 Connections

An SDM-SIO4 should be used if measuring the GPS16X-HVS with a CR5000 or CR9000X datalogger. An SC110 cable is required to connect the GPS16X-HVS to an SDM-SIO4. The SC110 consists of two cables. Use the cable that terminates in a 9-pin male connector (DTE). The stripped and tinned leads of that cable attach to the GPS16X-HVS (see TABLE C-1).

TABLE C-1. SC110's Cable Wiring					
Wire Color of SC110's Cable	Wire Color of GPS16X-HVS	Power Supply			
Brown	Gray	N/A			
White	White	N/A			
Yellow	Shield	N/A			
N/A	Red	+12 V			
N/A	Black	Power Ground
