

CDM-A108 and CDM-A116

Analog Measurement Modules

24-Bit Resolution

Greatly Increases Sensor Capacity

Overview

The CDM-A108 and CDM-A116 are 24-bit analog input modules that significantly increase the number of analog channels in a datalogger system. The CDM-A108 has eight differential channels and the CDM-A116 has 16 differential channels.

The CDM-A108 and CDM-A116 feature a 24-bit, analog-to-digital converter and a low-noise, analog front-end to provide superior analog measurements. They also can make simultaneous measurements, support period average measurements, and include both current and voltage excitation channels.

Benefits and Features

- › 8 differential or 16 single-ended inputs on the CDM-A108
- › 16 differential or 32 single-ended inputs on the CDM-A116

¹ First notch frequency

² Range overhead of ~6% on all ranges guarantees that full-scale values will not cause clipping

³ Effective resolution (ER) in bits is computed from ratio of full-scale range to RMS noise.
