Overview
The CDM-A108 and CDM-A116 are 24-bit analog input modules that significantly increase the number of analog channels in a datalogger system. The CDM-A108 has eight differential channels and the CDM-A116 has 16 differential channels. The CDM-A108 and CDM-A116 feature a 24-bit, analog-to-digital converter and a low-noise, analog front-end to provide superior analog measurements. They also can make simultaneous measurements, support period average measurements, and include both current and voltage excitation channels.

Benefits and Features
- 8 differential or 16 single-ended inputs on the CDM-A108
- 16 differential or 32 single-ended inputs on the CDM-A116
- Ability to make simultaneous measurements
- 3.0 kHz maximum multiplexed sample rate using fast (100 μs) input settling
- 30 kHz maximum burst sample rate
- 24-bit sigma-delta ADC with 16 user programmable notch frequencies from 30000 Hz to 2.5 Hz, including 50 and 60 Hz. Previous generations of dataloggers could notch out 50 or 60 Hz
- ±5000 mV, ±1000 mV, and ±200 mV input ranges

1 First notch frequency
2 Range overhead of ~6% on all ranges guarantees that full-scale values will not cause over range.
3 Effective resolution (ER) in bits is computed from ratio of full-scale range to RMS noise.

Warranty
- One year against defects in materials and workmanship.
