

All CR300 dataloggers are tested and guaranteed to meet electrical specifications in a standard -40° to $+70^{\circ}\text{C}$ non-condensing environment. Datalogger recalibration is recommended every three years. System configuration and critical specifications should be confirmed with Campbell Scientific before purchase.

DRIVE CURRENT @ 3.5 V : 10 mA

MAXIMUM INPUT VOLTAGE: $-10\text{ V}/+15\text{ V}$

¹Range overhead of $\sim 10\%$ beyond range guarantees that full-scale values will not cause over range.

²Effective resolution (ER) in bits is computed from ratio of full-scale range to RMS resolution.

³Accuracy does not include the sensor and measurement noise.

⁴Assumes input reversal for differential measurements not including bridge resistor errors and sensor and measurement noise.

⁵Ratiometric accuracy, rather than absolute accuracy, determines overall measurement accuracy of ratiometric resistance measurements.
