Guarantee

This equipment is guaranteed against defects in materials and workmanship. We will repair or replace products which prove to be defective during the guarantee period as detailed on your invoice, provided they are returned to us prepaid. The guarantee will not apply to:

- Equipment which has been modified or altered in any way without the written permission of Campbell Scientific
- Batteries
- Any product which has been subjected to misuse, neglect, acts of God or damage in transit.

Campbell Scientific will return guaranteed equipment by surface carrier prepaid. Campbell Scientific will not reimburse the claimant for costs incurred in removing and/or reinstalling equipment. This guarantee and the Company’s obligation thereunder is in lieu of all other guarantees, expressed or implied, including those of suitability and fitness for a particular purpose. Campbell Scientific is not liable for consequential damage.

Please inform us before returning equipment and obtain a Repair Reference Number whether the repair is under guarantee or not. Please state the faults as clearly as possible, and if the product is out of the guarantee period it should be accompanied by a purchase order. Quotations for repairs can be given on request. It is the policy of Campbell Scientific to protect the health of its employees and provide a safe working environment, in support of this policy a “Declaration of Hazardous Material and Decontamination” form will be issued for completion.

When returning equipment, the Repair Reference Number must be clearly marked on the outside of the package. Complete the “Declaration of Hazardous Material and Decontamination” form and ensure a completed copy is returned with your goods. Please note your Repair may not be processed if you do not include a copy of this form and Campbell Scientific Ltd reserves the right to return goods at the customers’ expense.

Note that goods sent air freight are subject to Customs clearance fees which Campbell Scientific will charge to customers. In many cases, these charges are greater than the cost of the repair.
# PLEASE READ FIRST

## Recycling information

At the end of this product’s life it should not be put in commercial or domestic refuse but sent for recycling. Any batteries contained within the product or used during the product's life should be removed from the product and also be sent to an appropriate recycling facility.

Campbell Scientific Ltd can advise on the recycling of the equipment and in some cases arrange collection and the correct disposal of it, although charges may apply for some items or territories.

For further advice or support, please contact Campbell Scientific Ltd, or your local agent.
Precautions

DANGER — MANY HAZARDS ARE ASSOCIATED WITH INSTALLING, USING, MAINTAINING, AND WORKING ON OR AROUND TRIPODS, TOWERS, AND ANY ATTACHMENTS TO TRIPODS AND TOWERS SUCH AS SENSORS, CROSSARMS, ENCLOSURES, ANTENNAS, ETC. FAILURE TO PROPERLY AND COMPLETELY ASSEMBLE, INSTALL, OPERATE, USE, AND MAINTAIN TRIPODS, TOWERS, AND ATTACHMENTS, AND FAILURE TO HEED WARNINGS, INCREASES THE RISK OF DEATH, ACCIDENT, SERIOUS INJURY, PROPERTY DAMAGE, AND PRODUCT FAILURE. TAKE ALL REASONABLE PRECAUTIONS TO AVOID THESE HAZARDS. CHECK WITH YOUR ORGANIZATION'S SAFETY COORDINATOR (OR POLICY) FOR PROCEDURES AND REQUIRED PROTECTIVE EQUIPMENT PRIOR TO PERFORMING ANY WORK.

Use tripods, towers, and attachments to tripods and towers only for purposes for which they are designed. Do not exceed design limits. Be familiar and comply with all instructions provided in product manuals. Manuals are available at www.campbellsci.eu or by telephoning +44(0) 1509 828 888 (UK). You are responsible for conformance with governing codes and regulations, including safety regulations, and the integrity and location of structures or land to which towers, tripods, and any attachments are attached. Installation sites should be evaluated and approved by a qualified engineer. If questions or concerns arise regarding installation, use, or maintenance of tripods, towers, attachments, or electrical connections, consult with a licensed and qualified engineer or electrician.

General
- Prior to performing site or installation work, obtain required approvals and permits. Comply with all governing structure-height regulations, such as those of the FAA in the USA.
- Use only qualified personnel for installation, use, and maintenance of tripods and towers, and any attachments to tripods and towers. The use of licensed and qualified contractors is highly recommended.
- Read all applicable instructions carefully and understand procedures thoroughly before beginning work.
- Wear a hardhat and eye protection, and take other appropriate safety precautions while working on or around tripods and towers.
- Do not climb tripods or towers at any time, and prohibit climbing by other persons. Take reasonable precautions to secure tripod and tower sites from trespassers.
- Use only manufacturer recommended parts, materials, and tools.

Utility and Electrical
- You can be killed or sustain serious bodily injury if the tripod, tower, or attachments you are installing, constructing, using, or maintaining, or a tool, stake, or anchor, come in contact with overhead or underground utility lines.
- Maintain a distance of at least one-and-one-half times structure height, or 20 feet, or the distance required by applicable law, whichever is greater, between overhead utility lines and the structure (tripod, tower, attachments, or tools).
- Prior to performing site or installation work, inform all utility companies and have all underground utilities marked.
- Comply with all electrical codes. Electrical equipment and related grounding devices should be installed by a licensed and qualified electrician.

Elevated Work and Weather
- Exercise extreme caution when performing elevated work.
- Use appropriate equipment and safety practices.
- During installation and maintenance, keep tower and tripod sites clear of un-trained or non-essential personnel. Take precautions to prevent elevated tools and objects from dropping.
- Do not perform any work in inclement weather, including wind, rain, snow, lightning, etc.

Maintenance
- Periodically (at least yearly) check for wear and damage, including corrosion, stress cracks, frayed cables, loose cable clamps, cable tightness, etc. and take necessary corrective actions.
- Periodically (at least yearly) check electrical ground connections.

WHILE EVERY ATTEMPT IS MADE TO EMBODY THE HIGHEST DEGREE OF SAFETY IN ALL CAMPBELL SCIENTIFIC PRODUCTS, THE CUSTOMER ASSUMES ALL RISK FROM ANY INJURY RESULTING FROM IMPROPER INSTALLATION, USE, OR MAINTENANCE OF TRIPODS, TOWERS, OR ATTACHMENTS TO TRIPODS AND TOWERS SUCH AS SENSORS, CROSSARMS, ENCLOSURES, ANTENNAS, ETC.
## CS135 Packing list

1. General Information

1.1 General Safety

This manual provides important safety considerations for the installation, operation and maintenance of the CS135. These safety considerations are classified into three levels:

**WARNING**

Warnings alert the installer or user to serious hazards. Ignoring these warnings could result in injury or death and/or irrevocable damage to the sensor unit.

---

**CAUTION**

Cautions warn of potential hazards. Ignoring these cautions could result in the sensor being damaged and data being lost.

---

**NOTE**

Notes highlight useful information in the installation, use and maintenance of this product. These should be followed carefully in order to gain the maximum benefit from the use of this product.

1.2 Sensor Unit Safety

The CS135 sensor has been checked for safety before leaving the factory and contains no internally replaceable or modifiable parts.
CS135 Ceilometer

WARNING
Do not modify the CS135 unit. Such modifications will lead to damage of the unit and could expose users to dangerous light levels and voltages.

WARNING
Do not attempt to repair the CS135 unit without consulting Campbell Scientific.

CAUTION
Ensure that the correct voltage supply is provided to the sensor.

1.3 Laser Safety

The CS135 sensor incorporates a InGaAs laser diode which is rated as a class 3B device. This is an embedded laser where the output from the sensor unit, through the optics, is minimised to class 1M. This classification indicates that viewing of the beam with the naked eye is safe but looking directly into the beam with optical instruments, e.g. binoculars can be dangerous.

From the laser head the output has the following characteristics:
Maximum pulse energy: 4800 nJ
Pulse duration: 100 ns
Pulse frequency: 10 kHz
Wavelength: 912 nm +/- 5 nm
EN 60825-1:2001

The sensor is marked with the following warning:

**INVISIBLE LASER RADIATION**
**DO NOT VIEW DIRECTLY WITH OPTICAL INSTRUMENTS**
**CLASS 1M LASER PRODUCT**

WARNING
Removing the laser module with the power applied to the CS135 or battery connected may expose the user to hazardous class 3B laser radiation.

No attempt should be made to operate the laser module outside of the housing.

WARNING
Check that the laser warning label on the sensor is still visible and can be clearly read on an annual basis.

When installing the sensor avoid pointing the laser housing towards areas where binoculars are in common use.
1.4 Electrical Safety

As the sensor is powered from potentially hazardous mains voltages the wiring of its power supply should only be carried out by personnel qualified to install electrical equipment. For permanent installations outside, this usually requires a certified electrician who is also familiar with local electrical and safety legislation. Some general guidance is given in Section 4.5, but the responsibility for the installation lies with that installer.

The unit is tested for electrical safety before despatch but may need subsequent testing according to local practice.

---

**NOTE**

The unit should only be serviced by trained personnel.

---

**WARNING**

Removal of electronic module covers or connectors while the unit is powered will expose the operator to potentially hazardous voltages and risk damage to the sensor.

---

2. Product Overview

![CS135 Ceilometer](img/cs135.png)

*Fig 2.1 CS135 Ceilometer*
2.1 Introduction

2.1.1 Overview

The CS135 is a LIDAR (LIght Detection And Ranging). It emits short pulses of near infra-red light into the atmosphere from a semiconductor laser. These are scattered back by aerosols including cloud droplets. The time between transmission of the pulse and the return signal gives the range, and therefore height, of the scattering aerosols. The variation in the strength of the back-scattered light signal with height gives a profile of scatter coefficients and allow cloud bases to be identified. If significant scattering is detected but there is no defined cloud base then a vertical visibility can be calculated.

The control system of the CS135 is divided into three modules, DSP, TOP and PSU as follows:

DSP is the main data processing and communications unit of the CS135. The DSP hosts two separate time keeping circuits. These are cross checked and an alarm produced if they disagree.

TOP provides a number of safety shutdown features such as over and under laser output level. It also contains the calibration circuitry and dirty windows system.

PSU controls the power supply, including battery charging and deep discharge protection.

The CS135 has a rugged environmental enclosure that protects the instrument from the harshest conditions and will measure the atmosphere with high stability and repeatability.

2.1.2 Cloud height detection

A scatter profile is measured as described in Appendix B.

Cloud height detection is carried out as described in Appendix C. Up to four cloud heights can be detected.

If no clouds are detected the CS135 will give one of the following reports:

- No significant backscatter.
- Full obscuration determined but no cloud base detected. This is reported if the criteria for detecting cloud base is not met but the integrated scattering coefficient reaches the limit of vertical visibility below a set height limit. The default value is 2000 m but can be changed by the user. The height at which this occurs is given as vertical visibility.
- Some obscuration detected but determined to be transparent is reported if scattering is detected but no cloud is detected and the calculated vertical visibility exceeds a set height limit.

If no cloud is detected but significant scattering is detected below 50 m then vertical visibility is set to 0.
2.1.3 Sky Condition

Sky condition is an assessment of cloud cover measured in units of eighths or 'oktas'. The number of oktas is the density of cloud in eighths of that layer. Up to 5 layers can be output by the CS135. The algorithm used in the CS135 follows guidance in ICAO 9837, Manual on Automatic Meteorological Observing Systems at Aerodromes.

Note that sky condition assessment is based on cloud data for the previous 30 minutes, with cloud detection in the previous 10 minutes given an extra weighting and is not an instantaneous measurement. Therefore it will not be available before sufficient data has been collected. See Appendix D for more detail.

2.1.4 Backscatter profile reporting

Several possible data messages give the two-way attenuated backscatter profile. This consists of 2048 groups of five-character hexadecimal values (10240 characters in total). Each character is 4 bits long and therefore each 5 figure group is 20 bits. They are given as signed two’s complement integers and numbers greater than $2^{19}$ represent negative integers.

Therefore each group actually represents negative a value between $-2^{19}$ to $+(2^{19} - 1)$, rather than 0 to $(2^{20} - 1)$, which would be the case for unsigned, positive, 20-bit integers.

In order to translate this to the correct decimal value, a two stage process should be applied. This is as follows:

1. Convert from a hexadecimal to a decimal number.

2. If the resulting decimal number lies in the range 0 to 524287 ($2^{19} - 1$) then nothing further needs to be done. If the number resulting from this conversion is greater than 524287 then subtract 1048576 ($2^{20}$).

In order to use this backscatter coefficient in units of sr$^{-1}$ m$^{-1}$ this calculated decimal number has to be multiplied by a factor of $10^8$. The values are scaled by the $\text{Attenuated\_SCALE}$ parameter, see Table 5.1.

---

**NOTE**
The last two values of the profile will always be zero by design (they are beyond the 10 km range of the instrument).

---

**NOTE**
The profile is not corrected for tilt angle even if cloud heights are corrected.

2.1.5 Mixing layer height

A Mixing Layer Height measurement option is available. This retrieves the height of the mixed aerosol layer by applying the gradient method to the ceilometer’s backscatter signal. This approach, based on the operational algorithm used by KNMI*, searches for the drop in backscatter associated with the transition from boundary layer aerosols to free troposphere. Since the signals measured depend on the type and amount of aerosol present as well as the background light level, the accuracy of the method varies and therefore a quality factor is assigned which indicates the confidence in the reported layer height. The module is also capable of
indicating the top of residual layers and aerosol layers aloft. To activate this option please contact Campbell Scientific.

This is a guide to how well the mixing layer is defined on a scale 1 to 3 (3 is best). It is determined by the magnitude of the difference between the average backscatter over a distance below the MLH and the average backscatter over a distance above the MLH.

2.2 Optical Measurement

2.2.1 Optical Arrangement

The CS135 employs a novel single split-lens design to increase optical signal to noise ratio while maintaining Class 1M eye safety by integrating larger optics into a compact package (see Fig 2.2). One half of the lens is used by the transmitter, the other by the receiver. They are therefore very close. This design provides an alternative to traditional two lens or common-optics designs. The optical isolation of traditional biaxial systems is maintained to increase detector sensitivity, while the low overlap onset height of common-optics systems is incorporated to allow measurements at close ranges.

2.3 Internal Monitoring

The CS135 monitors a large number of parameters relevant to its performance. These include window contamination, key voltages and currents and internal temperature and relative humidity. Data messages, see Section 5, include this information allowing remote diagnosis of the CS135 condition. In addition a special status message can be polled.
2.4 Specifications

2.4.1 Measurement Specifications

- Maximum Reporting Range: 10 km / 32,800 ft
- Minimum Reporting Resolution: 5 m / 15 ft
- Hard Target Range Accuracy: +/- 0.25% +/- 4.6 m
- Reporting Cycle: 2 to 600s
- Cloud Layers Reported: Up to four layers reported.

2.4.2 Mechanical Specifications

- Height: 1000 mm
- Width: 327 mm
- Depth: 281 mm
- Total weight: 33 kg (excluding cables)
- Packed weight: 58 kg

---

Fig 2.3 CS135 Dimensions
2.4.3 Electrical Specifications

Power required: Nominal 115 (106-137) or nominal 230 (216-253) VAC, 47-63 Hz, 470 W maximum in total.

The hood heater requires a maximum of 270 W.

The internal heater requires a maximum of 120 W.

The supply voltage required is specified at the time of order.

Fuses: The fuse should be HBC SA(T). Older units contained:

<table>
<thead>
<tr>
<th>AUX fuse</th>
<th>HBC 5 A (T)</th>
</tr>
</thead>
<tbody>
<tr>
<td>PSU fuse</td>
<td>HBC 500 mA (T)</td>
</tr>
</tbody>
</table>

**CAUTION**

The fuse values used must match the design of power supply unit.

All fuses are 5 x 20 mm slow blow (T) and are the same for both 115 VAC and 230 VAC.

Battery: Internal 12V 2Ah sealed lead-acid battery provides 2hr measurement without the blower/heater. The power supply is equipped with a system to prevent deep discharge of the battery.

The CS135 uses Positive Temperature Coefficient (PTC) heaters within its design. These heaters are self-regulating, simplifying the internal design of the sensor and improving safety. Due to the nature of these devices the CS135 takes a higher current during start up.

The CS135 will take up to 1 KW for the first few seconds of operation dropping off quickly to its normal operating power over a period of a minute.

In cold environments the power consumption of the CS135 may be as high as 470 W. Also, in warmer environments it may be as low as 200 W.

The heaters within the CS135 are purely resistive which will prove advantageous when connected to generators or when the power factor of your supply is important.
2.4.4 Optical Specifications

- Pulse duration: 100 ns
- Pulse frequency: 10 kHz
- Wavelength: 912 ± 5 nm
- Half-angle laser divergence: 0.35 mrad
- Field of view: 1.5 mrad
- Laser lifetime: 10 years typical
- Eye safety class: 1M
2.4.5 Environmental Specifications

Standard Operating Temperature Range: -40°C to +60°C (Excluding battery, battery temperature range: -20°C to +50°C. Alternative battery types available).

Relative Humidity Range: 0 to 100%

IP Rating: IP 66

Maximum wind speed: 55 m/s

2.4.6 Communications Specifications

Supported serial settings
- 8 bits, no parity, 1 stop bit (default)
- 7 bits, even parity, 1 stop bit
- 7 bits, odd parity, 1 stop bit

Supported data rates
- 300 bps
- 600 baud
- 1200 baud
- 2400 baud
- 4800 baud
- 9600 baud
- 19200 baud
- 38400 baud
- 57600 baud
- 76800 baud
- 115200 baud (default)

Supported standards
- RS-232
- RS-485 full duplex
- RS-485 half duplex
3. Initial preparation and checks

The following steps will provide basic familiarisation with the CS135 and perform basic functionality checks. To do these you must first remove the cover and enclosure lid (see Sections 4.6.1 and 4.6.2) and then connect the battery (see Section 4.6). Then connect the hood heater plug. See Fig 4.3 in Section 4.5.1.

**WARNING**

The laser will be operating as soon as the battery is connected. It should not point in any direction where it could be viewed with magnifying optics.

The green LED visible from above should now be flashing once every 10 seconds (see Fig 5.2).

Connect a PC using a terminal emulation program to the USB port (Fig 4.5). The terminal emulator should be set to 115200 baud, 8N1 bits/parity.

PC operating systems should identify the USB connection and allocate a port number. The terminal emulator program you are using should then be set to this port number. Older PC operating systems may need upgrading or additional software.

The CS135 will be outputting message type 001 every 10 seconds (see Section 6.2).

Open terminal mode with the command “open 0”. You should now see the prompt “CS135>”, Type “Status”. You will now see the sensor status information described in Section 5.1.5. If you plan to use date/time information this should be checked as it can drift up to ±14 seconds per day.
If the unit has been in storage or transit for more than a few months, the clock battery may be discharged. However, it will charge from the back-up battery or mains power.

Close terminal mode with the command “close” (it will close automatically after 10 minutes of inactivity).

If you are not installing the unit and connecting mains power straight away you should disconnect the battery to avoid it being discharged.

4. Installation

4.1 Location and Orientation

The CS135 measures environmental variables and is designed to be located in harsh weather conditions. However there are a few considerations to take into account if accurate and representative data from a site are to be obtained.

In order to reduce the service frequency with the unit, the CS135 should be placed away from sources of contamination. More regular maintenance will be required when the instrument is placed in areas where contamination is unavoidable or where measurements may be safety related.

Take care that the orientation allows tilting in whatever direction is desired.

---

**WARNING**

If installing at an airport check and follow local guidance for allowed locations for a non-frangible object 1m tall. Please contact Campbell Scientific if frangible fittings are required.

---

4.2 Grounding

The CS135 must be properly grounded by taking a ground wire with a minimum cross sectional area of 16 mm² and maximum length of 10 m from the brass grounding boss to an adequate grounding point. Figure 4.3 shows the location of the grounding boss.

4.3 Mounting the CS135

The CS135 is designed to be bolted to a firm, level foundation. When bolting down take care that the orientation allows tilting in whatever direction is desired.

Fig 4.1 shows the mounting footprint.

If a suitable surface does not already exist then a concrete foundation should be constructed at least 600 mm square and 600 mm deep.

Drill four 12 mm diameter holes using the mount base as a template to a depth of 77 mm.

Clean the holes of all debris.

Place washers and nuts on the ends of the wedge anchors supplied (to protect the threads during installation).
Hammer the wedge anchors into the holes until the start of the threads are below the surface.

Tighten the nuts until about 25 mm of thread protrudes above the surface.

Remove the washers and nuts from the protruding length screw. Then lower the CS135 into place.

Finally, secure the CS135 with the washers and nuts.

If the surface is not level and flat it may be necessary to add washers under the base on one or more of the foundation screws.

Fig 4.1 Mounting footprint
4.4 Tilt Angle

The CS135 is designed to be tilted 6°, 12°, 18° or 24° from vertical. There are several reasons why this might be done. In tropical regions it might be advantageous to tilt the sensor north in the northern hemisphere and south in the southern hemisphere to prevent the sun shining directly into it, it can reduce problems caused by direct specular reflections from ice crystals and reduce problems from rain or snow falling onto the window. To adjust the tilt angle remove the bolts shown in Fig 4.2, move the CS135 to the required tilt angle and replace them.

The CS135 has tilt sensors in both axes so that if it is not possible to provide a level base cloud height can be compensated. Cloud height compensation can be set or disabled using the UNITS command (see Section 5.1.3). This feature can be useful for mobile or marine applications. Note that profile data is NOT compensated but tilt angles are included in data messages.

Note that increasing the tilt angle beyond 24° can cause significant errors in vertical visibility measurements if scatter coefficients vary significantly with height.
4.5 Connectors and wiring

4.5.1 Base connectors

The CS135 has three connectors on its base. One is for communications, one provides power input to the unit itself and the other one takes power from the unit to the hood heater and blower.

NOTE
Tilting the unit will provide better access to these connectors.

Fig 4.3 Connector Layout

The function of the connector pins is shown in Table 4.1.

### Communications Connector

### 4.5.2 Wiring Using Supplied Campbell Scientific Cables

Two cables are supplied, each 10 m long. One is for the mains power supply, the other is for communications.

**WARNING**

If the power cable is incorrectly wired then irreparable damage can be done to the unit and there is risk of serious injury or death.
4.5.2.1 Power Connections

The following guidance is given to help the wiring and installation of a permanent power supply to the sensor.

As the sensor is used outside, the installation of the power cables will normally have to be carried out by a qualified electrician. Please check local safety regulations.

A mains power source needs to be identified and the type of termination, cable type and cable run matched to comply with local regulations and the type of installation.

The power source needs to be able to provide the correct voltage and frequency and current in excess of the power requirement of the system. See below.

Voltage requirements: 106-137V or 216-253V AC (check power supply switch and fuses match the nominal 115/230V supply)

Current requirements: 5A

Input frequency: 47-63 Hz.

The power source needs to be fused. The fuse rating should be 5A or larger and a “slow blow” design. Any extensions to the cable supplied or alternative replacement should be capable of carrying current in excess of that fuse rating.

The power source should be fitted with a two-pole isolator and should be fitted as near to the sensor as is possible.

The power cable needs to have three conductors, live, neutral and a protective earth, normally with IEC wiring colours to match those used.

This equipment requires a protective earth. THIS MUST BE CONNECTED FOR SAFETY REASONS. Ensure the earth connection at the power source is suitable for this purpose. The connection should be made via the earth wire of the power connector/cable or via the earth stud on the sensor base.

This equipment also requires correct connection of the live and neutral conductors – make sure these are identified and wired correctly at the power source.

Normally, the power source should be fitted with its own or system wide earth leakage breaker (also known as an RCD).

For short term testing of the sensor a suitable plug can be fitted to the end of the power cable and the sensor plugged into a standard mains supply capable of providing 5A at the rated voltage. If this is done the earth wire of the sensor must be connected to a suitable protective earth point.
4.5.2.2 Communications connections

The communications cable is terminated at one end with a removable 9 pin D-connector (DB9). The D-connector can be connected directly to a PC or data logger such as the Campbell Scientific CR1000 using a suitable interconnecting cable such as the SC110. Connections and wire colours are shown in Fig 4.4. The connector can easily be removed for direct connection to screws terminals.

CAUTION

The type of cable supplied is not recommended for lengths greater than 10 m. In particular, longer length RS-485 cables should incorporate twisted pairs. Please contact Campbell Scientific if you wish to use a longer length of cable.

CS135 COMMS CABLE CONNECTOR

Fig 4.4 Cable Connections

Tilting the unit, see Fig 4.2, will make wiring easier.

4.5.3 USB Connection

A USB port is provided inside the enclosure to aid on-site maintenance. This allows communication of commands to the CS135 and responses in the same form as the main serial port except that the baud rate is fixed at 115200 (see Fig 4.5).

4.5.4 SDI-12 Connection

A SDI-12 port is present but is only used for factory setting of the instrument.
4.6 Connecting the Back-up Battery

The CS135 will be shipped with the back-up battery disconnected. It should be connected as shown in Fig 4.6 before bringing the unit into use.

To do this the cover and enclosure lid must first be removed. The desiccant included for transport should be removed at the same time.
4.6.1 Removing the Cover

The cover is removed by removing the four screws as shown in Fig 4.7.

The cover can then be lifted away.

CAUTION

The cover contains a flying lead used to take power to the hood heater and blower. Be careful not to trap and damage this when lifting the cover clear.

4.6.2 Removing the Enclosure Lid

Removing the lid covering the electronics unit is accomplished by removing the four screws as shown in Fig 4.8.
4.7 Bird Spike Kit

A bird spike kit, part number 009349, is available to deter birds from sitting on the CS135. This comprises 4 stainless ‘spikes’ with rounded ends and a small reel of stainless wire. Fig 4.9 shows installed bird spikes.

Fig 4.9  CS135 Bird Spike Kit installed

To install the bird spikes first remove the cowl and blanking plugs from the cowl as shown in Fig 4.10. If the CS135 is an older unit without pre-existing holes then it will be necessary to drill 4 holes each 4.5 mm diameter, evenly spaced around the aperture and 10 mm in from the edge. Each spike is then inserted into the holes, thread first, and nuts and washers attached and tightened, see Fig 4.11. Then replace the cowl on the CS135.
Finally wrap stainless steel wire around the spikes using the grooves in the spikes. The wire is easily wrapped around each spike in turn and then back on itself. Do not tighten the wire too much as it may pull the spikes inwards and obscure the field of view of the CS135 optics.

Only use one strand of wire to reduce the possibility of water drops being collected.

Check the wire during maintenance and replace if necessary.

### 4.8 Storage Information

The CS135 should be stored between -40°C to +70°C in a dry place, preferably with the enclosures securely fastened. The optics should be protected from possible accidental damage. For storage the back-up battery should be disconnected.

**NOTE**

Leaving the battery connected during storage will mean that the unit will still be powered until the battery voltage falls below a shutdown threshold.
If the CS135 has been stored below 0.0°C the start-up time will progressively take longer - up to 10 minutes. Full accuracy will not be achieved for an hour at -20°C.

The battery has a temperature range of -20°C to +50°C and should be removed if the CS135 is to be stored outside this range.

5. Operation

5.1 Terminal mode

5.1.1 Entering/Exiting the CS135 Terminal Mode

The menu system is entered with the command OPEN Sensor_ID Password (The menu will time out & close automatically if not used for 10 minutes).

Sensor_ID is the CS135 identification, a single ASCII character 0-9,a-f,A-F case sensitive. The default is 0. If a password is set then it must be entered here otherwise it can be omitted. The following text should now be displayed: "CS135>". The CS135 is now ready for terminal mode commands.

The CS135 Commands are not case sensitive. The Parameters and/or password following the command are case sensitive.

Example of the “open” command followed by the parameter “0”:

```
OPEN 0
```

Example of the open command with the password “Secret”:

```
OPEN 0 Secret
```

5.1.2 Terminal Mode Commands General

Table 5.1 gives a summary of the terminal mode commands available.

The CS135 can be setup and controlled by using the terminal interface where discrete commands are sent. The terminal commands can be sent via a logger to the CS135 removing the need for a local PC to set up the unit.
The terminal emulators built into many Campbell Scientific software products can also be used. Note however that DevConfig and PW Viewer cannot be used to load a new operating system as this requires XMODEM protocol. One common, freely available terminal emulator with this feature is called “TeraTerm” which is easily available on the internet.

The following settings are used:

<table>
<thead>
<tr>
<th>RS-232/422/485 interface (default)</th>
<th>USB service port</th>
</tr>
</thead>
<tbody>
<tr>
<td>RS-232 hand shaking</td>
<td>Baud: rate 115200</td>
</tr>
<tr>
<td>Baud rate: 115200</td>
<td>Data bits: 8</td>
</tr>
<tr>
<td>Data bits: 8</td>
<td>Parity: none</td>
</tr>
<tr>
<td>Parity: none</td>
<td>Stop bits: 1</td>
</tr>
<tr>
<td>Stop bits: 1</td>
<td>Flow control: none</td>
</tr>
<tr>
<td>Flow control: none</td>
<td></td>
</tr>
</tbody>
</table>

Ensure that if the baud rate of the unit has been adjusted and then the corresponding bits per second value are entered in the port settings of the terminal emulator. The CS135 should now be ready to accept commands.

Note: commands will always output all parameters on a new line after a CR LF & then the CS135 prompt ‘CS135>’. If you only want to see parameter values without changing them then enter the command without parameters. If a particular parameter did not need changing then the parameter can be replaced with a comma (,). Back space will abort the command.

### 5.1.3 Terminal mode command examples

The following text shows an example of setting up the CS135 serial port. This example would set the serial port to RS-232 hand shaking at 115200 bps, 8 data bits, no parity and if it was in RS-485 mode then a 100mS turn around delay.

```
serial 0 10 0 100
```

You could also type the following to obtain the same results as the RS-485 turn around delay is not needed:

```
serial 0 10 0
```

If all you wish to do is change the data baud rate and nothing else you can replace the first number, the mode parameter, with a ‘,’ as shown below.

```
serial , 10
```

Alternatively if you just wished to change the parity to 8-bits no parity then type the following:

```
serial , , 0
```

You do not need to replace the remaining parameters with ‘,’ you only need to replace the ones up to the parameter you wish to edit.

---

**NOTE**

Remember to leave a space character between the command and the parameters as shown in the examples.
Table 5.1  Summary of the terminal mode commands available

<table>
<thead>
<tr>
<th>Command</th>
<th>Parameter/ Parameter block</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALARMS</td>
<td>Angle</td>
<td>Angle is the threshold tilt angle of the sensor beyond which an alarm will be flagged. The settable range is 0 to 90.0 degrees tilt and the default is 45.0 degrees.</td>
</tr>
</tbody>
</table>
| BS (see Section 5.1.5 for more information on compatibility of different parameters) | Attenuated_SCALE, BS_Av_Time, Noise_Gate, Measurement_Period, Rolling_Average, Message_Interval | Rules for BS command are:

- BS_Av_Time <= Measurement_Interval -1.
- Message_Interval must be a multiple of Measurement_Period.

Attenuated_SCALE is the scalar for the attenuated backscatter %. 0.001 to 1000 (default 100%)

BS_Av_Time is the backscatter average time in seconds. 1 to 30 (default 2).

Note: Must not be greater than Measurement_Period -1.0

Noise_Gate controls the noise threshold applied to back-scatter. Noise_Gate = -1000, all backscatter range is corrected. Noise_Gate = 0.0-1000.0, standard deviation for noise threshold, default 2.0. Only backscatter above this is range corrected.

Measurement_Period 0 or 2 to 600 (default 10). If set to 0 and the CS135 is polled it will output the last measurement made. If it is between 2 and 600 seconds then the CS135 will continually output messages. For sky condition output it is recommended that the measurement_Period is set no longer than 30 seconds. If a measurement_Period greater than 30 seconds is used then the sky condition algorithm will be less able to resolve coverage for higher layers.

Note: Must be a sub multiple of Message_Interval

Rolling_Average = 1 to 29 default 1. This is the number of measurement_periods to use in a rolling average of the backscatter.

Message_Interval is the message interval in seconds, 2 - 600 seconds.

‘0’ gives polled messages, default 10.

Note: Must be a multiple of Measurement_Period |
| CLOSE   | No parameters            | Closes the terminal interface to allow normal message output and saves new settings to flash non-volatile storage. |
| DEFAULTS | No parameters            | Loads factory defaults |
| GETUSER |                          | Reads all user settings as a string of text. Parameters are read in the following order:

- user = text “user”
- volVer = user volume version
- OS_VER = DSP OS version
- PsuOsVer = PSU OS version
- TopOsVer = TOP OS version
- Id = CS135 ID
- Pw = CS135 password
- terminalCr = terminal crc mode
- terminalTimeOut = terminal timeout
- unitsTiltMode = units and tilt mode
- hoodHBM = hood heater / fan heater mode
- hoodHBTTestInt = hood heater / blower test interval in hours
- battBoost_mV = boost voltage used for battery charging mV
- battCharge_mA = battery charge current mA |
psuPresent = PSU present switch
hoodHBNormSpeed = Fan voltage for normal speed mV
hoodHBHighSpeed = Fan voltage for high speed mV
hoodHBLowSpeed = Fan voltage for low speed mV
intHMode = internal heater mode
message[0] = fields for message 0
message[1] = fields for message 1
message[4] = fields for message 4
messagePeriod = output message period in seconds
heightOffset = height offset metres
bsAvTime = backscatter average time in seconds
laserMode = laser operation mode
laserPower = laser power
laserHeater = laser heater mode
attenuatedSCALE = attenuated backscatter scaling factor
logInterval = debug logging interval
measurementPeriod = measurement interval in seconds
serMode = serial port mode
baudSel = serial port baud rate mode
dataParityStop = serial port parity mode
rx2txTimeout = serial port RX to TX turnaround time
snrMarginBoundary = onset of backscatter detection threshold
snrMarginDetector = cloud detection threshold
alphaGuessEnd = cloud alpha guess at boundary
alphaMin = cloud detection alpha minimum
Vcld_D = cloud detection delta
delta_Vcld_D = cloud detection
vis_Av_T = cloud detection
alphaGuess = visibility initial alpha guess
cap = visibility cap in metres
tiltLimit = tilt limit in degrees used by alarms
noiseGate = attenuated backscatter noise gate mode
vvLimit_percent = sky condition report vertical visibility %
alphaGuessStart = cloud detection alpha guess at lowest height bin
dt = mixing layer height temporal filter minutes
dr = mixing layer height range filter metres
q1threshold = mixing layer height quality threshold 1
q2threshold = mixing layer height quality threshold 2
q3threshold = mixing layer height quality threshold 3
stdWidth = mixing layer height standard deviation width metres
CRC = 4 digit ASCII hex CRC calculated from the ‘u’ of user up-to but not including the CRC using the standard CRC-16.

Note: Many of these parameters may not have been adjusted. This command allows a reliable technique for copying full settings from one CS135 to another with the ‘SETUSER’ command.

A typical response to the GETUSER command is:

>>>>>>>>>> COPY FROM START OF NEXT LINE >>>>>>>>>>

user 7 007638-6da 106 510 0 , 0 10 2 0 1 14520 400 1 1000 1000 2000 0 1 0 0 0 0 10 0.000E+00 2.000E+00 1 1.000E+00 0 1.000E+00 0 10 1 0 10 0 100 4.000E+00 6.000E+00 2.000E+00 100 2.000E+00 1.000E+00 1.000E+00 6.000E+00 2.500E-03 1.000E+03 2.200E+01 4.800E+03 1.000E-01 9.000E-01 2.500E-04 2.000E+03 4.500E+01 2.000E+00 50 2.00E+00 3.00E+01 1.500E+02 1.800E+00

<td>10 minutes.</td>
</tr>
</tbody>
</table>
TIME | Date_Time
---|---
| Date is in the format yyyy/mm/dd
| Time is in the format hh:mm:ss
| yyyy=year, mm=month, dd=day
| hh=hours, mm=minutes, ss=seconds
| (i.e. time 2013/05/25 10:00:00, would set the date and time to May 25th 2013 at 10:00:00)
| Note: The set time could drift by up to ±14 seconds a day.

UNITS | Units
---|---
| Sets measurement units and tilt correction.
| Units = 0, metres corrected by tilt.
| Units = 1, metres not corrected by tilt.
| Units = 2, feet corrected by tilt (default).
| Units = 3, feet not corrected by tilt.

UNLOCK | Key
---|---
| Key = a 12 digit ASCII hex key provided by CSL to unlock pay-for-features

VIS | Cap
---|---
| Cap is the vertical visibility maximum range 100 to 10000 in metres or 328 to 32808 in feet (default 2000 m or 6561 ft).

Note (1)
If AUTO is set then the Heater / blower will activate at 80°C if (sky condition > 1 okta coverage) or (cloud height < 3 Km AND sky condition > 1 okta coverage) OR window Tx < 80% OR precipitation detected. When the event has passed the blower/heater will remain active at 80°C for a further 15 minutes before going into a fan-off state and heater temperature average of approximately 40°C ready to be activated again.

5.1.4 MCFG command message types

The MCFG commands “Message_ID_x” parameter defines the following output types. Refer to Section 6 for further information on message output types.

<table>
<thead>
<tr>
<th>Message_ID_x</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>No message</td>
</tr>
<tr>
<td>001 (default)</td>
<td>Campbell Scientific Message 1, no sky condition, no profile data</td>
</tr>
<tr>
<td>002</td>
<td>Campbell Scientific Message 2, no sky condition, profile data, 2048 range bins, 5 m resolution</td>
</tr>
<tr>
<td>003</td>
<td>Campbell Scientific Message 3, sky condition, no profile data</td>
</tr>
<tr>
<td>004</td>
<td>Campbell Scientific Message 4, sky condition and profile data, 2048 range bins, 5 m resolution</td>
</tr>
<tr>
<td>005*</td>
<td>Campbell Scientific Message 5, sky condition, no profile data, mixing layer height</td>
</tr>
<tr>
<td>006*</td>
<td>Campbell Scientific Message 6, sky condition, profile data, 2048 range bins, 5 m resolution, mixing layer height</td>
</tr>
<tr>
<td>101</td>
<td>CL31 Message 1, 770 range bins, 10 m resolution</td>
</tr>
<tr>
<td>102</td>
<td>CL31 Message 1, 385 range bins, 20 m resolution</td>
</tr>
<tr>
<td>103</td>
<td>CL31 Message 1, 1500 range bins, 5 m resolution</td>
</tr>
<tr>
<td>104</td>
<td>CL31 Message 1, 770 range bins, 5 m resolution</td>
</tr>
<tr>
<td>105</td>
<td>CL31 Message 1, No profile data</td>
</tr>
<tr>
<td>106</td>
<td>CL31 Message 1, Full CS135 output, 2048 range bins, 5 m resolution</td>
</tr>
<tr>
<td>107</td>
<td>CL31 Message 2, 770 range bins, 10 m resolution</td>
</tr>
<tr>
<td>108</td>
<td>CL31 Message 2, 385 range bins, 20 m resolution</td>
</tr>
<tr>
<td>109</td>
<td>CL31 Message 2, 1500 range bins, 5 m resolution</td>
</tr>
<tr>
<td>110</td>
<td>CL31 Message 2, 770 range bins, 5 m resolution</td>
</tr>
<tr>
<td>111</td>
<td>CL31 Message 2, No profile data</td>
</tr>
<tr>
<td>112</td>
<td>CL31 Message 2, Full CS135 output, 2048 range bins, 5 m resolution</td>
</tr>
<tr>
<td>113</td>

</tr>
<tr>
<td>114</td>
<td>CT25K message 6</td>
</tr>
</tbody>
</table>

* only available if MLH option is active
5.1.5 Measurement and message intervals

The message interval is the interval in seconds, 2 to 10 or 20 to 600 in steps of 10, between automatic message transmission (‘0’ gives polled messages). The default is 10 meaning a message will be sent automatically every 10 seconds. It must be a multiple of measurement period.

The backscatter average time, BS_Av_Time, is the period over which the laser is firing and taking measurements.

The measurement period is the time interval between the start of a period of BS_Av_Time over which the laser fires and the start of the next. This period must be long enough to include the backscatter average time and some processing time. It should be 2 seconds at least and a sub-multiple of the message interval.

Rolling average is the periods used to calculate each scatter value that is either used in a profile message or in a calculation of cloud height.

The message interval may affect measurement parameters allowed within the ‘BS’ command (‘BS’ can set non-standard measurement parameters) as follows:

If Message_interval = Measurement_Period = 2 (lowest values allowed)
Then BS_Av_Time must = 1 and Rolling_Average must = 1

If 2 < Message_interval < 10
Then Measurement_Period must equal Message_interval, BS_Av_Time must equal 2 and Rolling_Average must equal 1

Yellow means laser firing

In this case the CS135 sends a message every 2 seconds based on 1 measurement averaged over 1 second at 2 second intervals.

Each message is based on a single 1 second period of average data.

<table>
<thead>
<tr>
<th>1s</th>
<th>2s</th>
<th>2s</th>
</tr>
</thead>
</table>

Averaging Period = 1s  \((BS_AV\_Time)\)
Measurement Period = 2s
Message Interval = 2s

In this case the CS135 sends a message every 30 seconds based on 3 measurements taking 2 seconds at 10 second intervals.

Each message is based on a single 2 second period of average data.

<table>
<thead>
<tr>
<th>2s</th>
<th>10s</th>
<th>30s</th>
</tr>
</thead>
</table>

Averaging Period = 2s  \((BS_AV\_Time)\)
Measurement Period = 10s
Message Interval = 30s
In this case the CS135 sends a message every 30 seconds based on 3 measurements taking 2 seconds at 10 second intervals.

Each message is based on three 2 second period of average data.

<table>
<thead>
<tr>
<th>2s</th>
<th>10s</th>
<th>30s</th>
</tr>
</thead>
</table>

Averaging Period = 2s \((BS\_AV\_Time)\)
Measurement Period = 10s
Message Interval = 30s
Rolling average = 3

In this case the CS135 sends a message every 14 seconds based on 1 measurement taking 4 seconds over a 14 second interval.

Each message is based on a single 4 second period of average data.

<table>
<thead>
<tr>
<th>4s</th>
<th>14s</th>
<th>14s</th>
<th>14s</th>
</tr>
</thead>
</table>

Averaging Period = 4s \((BS\_AV\_Time)\)
Measurement Period = 14s
Message Interval = 14s

This message cannot be set up using the MCFG command alone.
The BS command has to be used as follows:
BS_Av_Time (averaging period) has to be set to 4, not the default value.
5.1.6 STATUS command

The STATUS command returns the following information:

<table>

</table>
### 5.1.7 Message Polling

The command ‘POLL Sensor_ID Message_ID’ requests the message Message_ID from sensor Sensor_ID.
Where Message_ID is a CS135 message type as defined in Section 5.1.4.

The following example shows to use the CS135 POLL command to request preconfigured message outputs.

First configure the CS135 to use polling mode from the terminal interface via the “MCFG” command as follows:

```
“CS135> MCFG 0”
“0 1 0 0 0 0”
```

This configures the CS135 into polling mode leaving your message output configurations unchanged. Exit the terminal by typing the “close” command. This will save the changes you just made.

```
“CS135> CLOSE”
“COMMAND CLOSED”
```

Any automatic message outputs should not have stopped. Type the “POLL” command as shown below to verify that the system is working as expected. Note: Once you have exited the terminal characters will not be automatically echoed back to you.

```
POLL 0
```

This should return all messages you have set via the MCFG command. In this example, only one message output was set, the default message. So the POLL command will return text similar to that shown below. Note: If you have no message configured (i.e. MCFG returned 0 0 0 0 0) then nothing will be returned from the command you just typed.

```
“CS0100001
10 100 12345 ///// ///// ///// 000000000000”
abcd
```

The following example shows how to use the POLL command to request a specific message output type.

First configure the CS135 into polling mode as shown in the example above and exit the terminal interface. To poll the CS135 for a particular message type, type the following.

```
POLL 0 113
```

The example text above will request the “CT25K Message 1” and should look similar to the text below.

```
“CT00010
```
5.1.8 Loading a New Operating System (OS)

A new OS can be entered with the LOADOS module command. Note three different modules each have their own OS. The parameter module loads a new operating system into different modules as follows:

Module = 1, DSP (file type *.ldr)
Module = 2, TOP (file type *.hex)
Module = 3, PSU (file type *.hex)
Module = 4, DSP, TOP & PSU as one file, type *.ldr. This is the usual method.

**NOTE**
The new OS must be sent using xmodem protocol.

To load a new operating system:

Enter terminal mode by typing “Open 0” (for a sensor with the default ID “0”)

This will return the prompt “CS135>”

Type the command “LOADOS 4”

The CS135 will respond:

“Load OS into DSP
DO NOT REMOVE POWER DURING OS UPDATE!!!
Waiting for xmodem”

At this point use your terminal emulator to send the appropriate file. Loading the OS could take a few minutes.

When the process is complete the CS135 will return the message:

“Wait 40 sec for OS to restart”

after which it will resume operation according to the previously set operating parameters. It will no longer be in terminal mode.

**To load a new operating system into a CS135 with an OS between 4 and 7**

Enter terminal mode by typing “Open 0” (for a sensor with the default ID “0”)

This will return the prompt “CS135>”

Type the command “LOADOS 1”

The CS135 will respond:

“Load OS into DSP
DO NOT REMOVE POWER DURING OS UPDATE!!!
Waiting for xmodem”

At this point use your terminal emulator to send the *.ldr file using xmodem protocol.

Loading the OS could take a few minutes.

When the process is complete the CS135 will return the message:

“Wait 40 sec for OS to restart” after which it will resume operation according to the previously set operating parameters. It will no longer be in terminal mode.
DO NOT REBOOT THE CS135 AT THIS POINT

Again enter terminal mode by typing “Open 0” (for a sensor with the default ID “0”)
This will return the prompt “CS135->”
This time type the command “LOADOS 4”
The CS135 will respond:
“Load OS into DSP
DO NOT REMOVE POWER DURING OS UPDATE!!!
Waiting for xmodem”

At this point again use your terminal emulator to send the *.ldr file using
xmodem protocol.

Loading the OS could take a few minutes.
When the process is complete the CS135 will return the message:
“Wait 40 sec for OS to restart” after which it will resume operation according
to the previously set operating parameters. It will no longer be in terminal
mode.

To load a new operating system into a CS135 with an OS between 1 and 3

Operating systems earlier than 4 will need the boot loader updating, use the
LOADOS 1 command, not LOADOS 4, before a new DSP OS can be uploaded
so the first time the OS is loaded a verify error will be reported (this is normal)
as follows:
“Error writing word 32768
Verify OS
Error verifying word 327680 37020 4236”
You will then need to `reboot’ and then load the OS using the terminal
command ‘LOADOS 4’ to correctly load the OS without errors.

The process is as follows:

Enter terminal mode by typing “Open 0” (for a sensor with the default ID “0”)
This will return the prompt “CS135->”
Type the command “LOADOS 1”
The CS135 will respond:
“Load OS into DSP
DO NOT REMOVE POWER DURING OS UPDATE!!!
Waiting for xmodem”
At this point use your terminal emulator to send the *.ldr file using xmodem
protocol.

Loading the OS could take a few minutes.
When the process is complete the CS135 will return the message:

“Error writing word 32768
Verify OS
Error verifying word 327680 37020 4236”

NOW REBOOT THE CS135 USING THE “REBOOT” COMMAND

Wait 40 sec for OS to restart after which it will resume operation according
to the previously set operating parameters. It will no longer be in terminal mode.

Again enter terminal mode by typing “Open 0” (for a sensor with the default ID
“0”)
This will return the prompt “CS135->”
This time type the command “LOADOS 4”
The CS135 will respond:
“Load OS into DSP
DO NOT REMOVE POWER DURING OS UPDATE!!!
Waiting for xmodem”

At this point again use your terminal emulator to send the *.ldr file again using xmodem protocol.

Loading the OS could take a few minutes.
When the process is complete the CS135 will return the message:
“Wait 40 sec for OS to restart” after which it will resume operation according to the previously set operating parameters. It will no longer be in terminal mode.

It is good practice to re-boot the sensor after loading a new OS.

### 5.1.9 Stratocumulus backscatter calibration

The command ‘SCCAL’ allows a simple Stratocumulus backscatter calibration of the scatter coefficient measurements. This requires a human observer to confirm a stable Stratocumulus cloud layer between 250 m to 2500 m without holes, precipitation or reduced visibility and has been stable for at least 10 minutes prior to running this command.

Measurement Period should be set to 10s. See Table 5.1.

Enter terminal mode by typing “Open 0” (for a sensor with the default ID “0”).

This will return the prompt “CS135>”

Type the command “SCCAL”

The CS135 will respond:

“Stratocumulus calibration.
Enter height above sea level (m)? Press enter to continue:”

Enter the sensor height above sea level, for example 70 m and type return.

The CS135 will respond “70 m entered, is this correct? ‘Y’, ‘N’ or ‘Q’ ”

Type “Y” to confirm or if you have entered an incorrect number type “N” and you will be able to replace it. Typing “Q” will quit the calibration and return to the terminal command prompt.

The CS135 will now respond:

“For correct calibration a trained human observer must confirm that the layer is between 250 m to 2500 m and has been stable for at least 10 minutes without drizzle. Has the Stratocumulus been stable for at least 10 minutes? ‘Y’ or ‘N’ ”

To confirm type “Y”

The CS135 will respond:
“Old Stratocumulus calibration = 0.0282
New Stratocumulus calibration parameters = 0.0258 70 1328
Do you want to apply this calibration? ‘Y’ or ‘N’ ”

In this example 70 is the height of the sensor above sea level previously entered and 1210 is the cloud base in metres above the sensor.

As a very rough guide if the calibration factor has changed by less than 20% there is probably no need to change. If it has changed by a factor of 2 it is wise to run the service routine on the sensor (See 5.1.11).

Type “Y” to confirm and the CS135 will respond:

“Calibration saved.”

The following error messages may appear during the process.
• Error ... Time out.
• Error ... Cloud not detected or height not within limits (250 m to 2500 m).
• Try again when layer is stable.
• Error ... Not enough data available try again in 10 minutes.

5.1.10 CRC-16 Codes on terminal commands

If CRC-16 on mode is set using the “Terminal” command, all terminal commands need a CRC-16. A semi-colon is used to indicate start of the CRC-16 in 4 byte ASCII hex, for example “open 0;d2d5”. The CRC-16 is calculated either from the start of a new line or after a [STX] up to but not including the semi-colon. ETX can follow the CRC-16 if required.

The valid CRC-16 can be found for any command by entering the command with the 4 character CRC-16 after the semi-colon replaced with “????”. For example entering “open 0;????” gives the response “[CRLF]CRC>D2D5<CRC[CRLF” so d2d5 is the CRC-16.

The CRC-16 is not case sensitive.
The table below gives some commonly used CRC-16 codes.

<table>
<thead>
<tr>
<th>Terminal Command</th>
<th>CRC-16</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open 0</td>

<td>B576</td>
</tr>
<tr>
<td>Defaults</td>
<td>7D8E</td>
</tr>
<tr>
<td>Serial</td>
<td>7FCE</td>
</tr>
</tbody>
</table>

5.1.11 Service command

The service command triggers the CS135 to go through a series of tests including tests that require the white test surface (ceilometer calibration plate supplied) to be placed on the CS135 windows.

The service command results in the following procedures:

- System noise level including noise spike test
- Detector maximum gain test
- Simulates a clear night sky for calibration offset
- Window contamination functionality test
- Laser function and monitoring alarm check
- Thermistor fault alarm check
- Calibrator LED alarm check
- PSU supply alarm check
- Temperature RH% sensor alarm check
- Inclinometer alarm check
- Heater / blower alarm check
- Internal clocks alarm check
- Top board and PSU communications alarm check

If any test or check has failed then full instrument status and debug information is output with a fault summary at the end.

The response is similar to the following:

Initially the CS135 will output a ‘STATUS’ message. It will then go through various self-test routines and before requesting a white test surface to be placed over each of the windows in turn. This process is as follows:

    self test, please wait
    wait for new measurement..................
    Place white test surface onto detector window (left hand side fan at the top)
    Press enter key to continue

At this point cover the detector window and press the ‘Enter’ key.

    wait for new measurement...........
    Place white test surface onto laser window (right hand side fan at the top)
    Press enter key to continue

At this point cover the laser window and press the ‘Enter’ key.
wait for new measurement....................
Remove white test surface from laser window. Press enter key to continue

When this is complete the CS135 will output a string of diagnostic data similar. This can be very useful for a Campbell Scientific engineer investigating problems with the CS135.

Finally the CS135 will list any faults found as shown below:

******** CS135 FAULT list ********
FAULT - external heater/blower thermistor
FAULT - detector dirty windows with white test surface
FAULT - max APD gain not achieved

Otherwise it will report the following message:
******** CS135 has PASSED all tests ********

5.1.12 Locked features
Optional features such as Mixing Layer Height assessment are protected by a 'key'. They are enabled by typing the command 'UNLOCK' followed by the key. This is specific to the individual CS135 and only has to be entered once.

5.2 Restoring Factory Defaults
Factory defaults can be restored using the terminal mode command “DEFAULTS”. Alternatively, they can be set using a push switch on the DSP as shown in Fig 5.1. The cover and enclosure lid first have to be removed. Please refer to Sections 4.6.1 and 4.6.2.

If the switch is pushed for four seconds the CS135 will reboot in exactly the same way as the REBOOT terminal command. If it is held closed while the CS135 is powered off and on again it will return to factory defaults. Note that to power cycle the CS135 the battery has to be disconnected as well as switching the main power off and on.
5.3 LED Indicator

A green LED is visible through the window, see Fig 5.2. It will give 0.5 second flashes as follows:

1 flash every 10 seconds = OK, no fault
2 flashes every 10 seconds = warning (possible degraded performance)
3 flashes every 10 seconds = alarm (measurements not possible)

6. Messages

6.1 Data Messages General

The CS135 can provide a variety of data message types to allow efficient output of data. Not all messages provide the full information available but these messages may be more efficient in terms of data storage and transmission.

CL31 and CT25K messages follow formats used by common existing CL31 and CT25K sensors allowing easier replacement or network expansion.

6.2 Checksums used in CS135 messages

This is based on the CCITT-16 CRC-16 with the output XOR’d with Hex 0xFFFF and outputs a two byte CRC-16 in hex format (four ASCII characters). The CRC-16 is calculated on all characters after the SOH character up to and including the ETX character.

The following example ‘C’ code calculates the CS135 checksum.

Note - ‘shorts’ are 16 bits long and ‘ints’ are 32 bits long.
/*********************************************************/
/* Calculate CRC-16 */
/* buf is a pointer to the input string */
/* len is the length of the input string */
/* *********************************************************/

unsigned short crc16(char *buffer, int length)
{
    unsigned short crc;
    unsigned short m;
    int i, j;

    crc = 0xFFFF;

    for (i=0; i < length; ++i)
    {
        crc ^= buffer[i] << 8;

        for (j=0; j<8; ++j)
        {
            m = (crc & 0x8000) ? 0x1021 : 0;
            crc <<= 1;
            crc ^= m;
        }
    }

    crc ^= 0xFFFF;

    return crc;
}

\( d_{4} \) (1 character) = Cloud amount of the 4th layer in oktas

\( h_{4}h_{4}h_{4} \) (3 characters) = Height of the 4th cloud layer in 10s of metres or 100s of feet, if no 4th layer is reported \( h_{4}h_{4}h_{4} = '///' \).

\( CR\ LF = \) Carriage Return + Line Feed

Note cloud amount and height cannot be reported until the CS135 has been operating for 30 minutes.
7. Maintenance

7.1 General

The CS135 is a robust weather resistant instrument and there is no need for routine maintenance other than cleaning. The instrument performance is monitored and any potential problems are covered by error messages.

7.2 Cleaning

The CS135 window will require cleaning from time to time. The frequency of required cleaning depends on the exposure of the instrument to contaminants such as salt and dust. This will vary depending on the site location. The CS135 is capable of self diagnosing dirty lenses and will indicate in its output when the lenses are contaminated.

In any case we suggest six monthly intervals for locations not prone to contaminants and monthly intervals for those prone to contamination (coastal, roadside or airport use). In some cases more frequent cleaning may be required where there are high levels of contaminants and high dependency on the instrument output.

---

CAUTION

If the window requires cleaning, it is very important that only a proper lens cloth or lens tissue is used. The use of inappropriate materials to clean the windows can permanently damage or reduce their effectiveness leading to reduced performance.
It is advisable to use an air duster to blow any loose dust and dirt from the window as a first step. Using a lint free lens cloth or lens tissue impregnated with a non-aggressive standard window cleaner. Clean the surface by dragging the cloth across it being careful not to apply excessive pressure.

Excessive pressure may lead to some types of contaminant scratching the window surface. Over time such scratches can lead to reduced sensitivity.

7.3 Removing the Cover

The cover is removed by removing the four screws as shown in Fig 7.1.

![Fig 7.1 Removing the Cover]

The cover can then be lifted away.

**CAUTION**

The cover contains a flying lead used to take power to the hood heater and blower. Be careful not to trap and damage this when lifting the cover clear.

Removing the cover reveals two carrying handles that allow the CS135 to be moved easily.
7.4 Removing the Enclosure Lid

In some circumstances it may be necessary to remove the lid covering the electronics unit, for example to replace desiccant or carry out a hardware reset. This is accomplished by removing the four screws as shown in Fig 7.2.

![Diagram of removing the enclosure lid](Image)

**WARNING**
Opening enclosure lid **MUST** be carried out by a competent person.

**WARNING**
Removing the enclosure lid may expose hot surfaces.

**NOTE**
The unit will still be powered by the battery even if the mains is disconnected.

**NOTE**
Do not use any grease or oil on any seals including the enclosure lid gasket. The silicone rubber seals used throughout the CS135 can be damaged by some mineral oils.
7.5 Diagnostic LED Indicators Within the Enclosure

Two green LEDs labelled "LASER ON" and "STATUS" are visible on the DSP (see Fig 7.3). Their function is as follows:

"LASER ON" LED:
- Off = laser off
- Flashing = laser fault
- On = laser on

"STATUS" LED
- 1 flash every 10 seconds = OK
- 2 flashes every 10 seconds = warning (possible degraded performance)
- 3 flashes every 10 seconds = alarm (measurements not possible)

The DSP "STATUS" LED duplicates the LED visible through the top window.

There is a red LED on the PSU. It will give 0.5 second flashes as follows:

- 1 flash every 10 seconds = PSU OK
- 2 flashes every 10 seconds = running in battery mode
- 3 flashes every 10 seconds = no communications to the DSP. This takes 60 seconds to start after a communications failure.

There is a red LED on the Laser module

- Off = Laser off
- On = Laser on
7.6 Electrical Safety Testing

**NOTE**

If carrying out insulation tests do not use voltages above 300V RMS as the mains input has devices that effectively short circuit any voltages above this level.

Appendix B. Measurement of the attenuated backscatter profile

B.1 Initial measurement

- Pulse the laser and measure the backscatter at optimal gains.
- Derive the impulse response and impulse correct the backscatter signal using the inverse filter derived.
- Remove the residual offset and slope from the impulse corrected backscatter.
- Apply an overlap correction based on the known generic overlap function of the CS135.
- Apply the backscatter calibration constants.
- Remove the laser and electronic artefact signature. This is specific to the individual CS135 and determined during calibration.

B.2 Backscatter onset height detection

- Filter the backscatter with 20 m and 300 m width filters.
- Look for a 1500 m block width where the standard deviation is at a minimum for both the 20 m and 300 m width filtered backscatters.
- Create a detection threshold by multiplying the 20 m and 300 m standard deviations by a constant.
- Find the onset of backscatter height by working from the highest height bin downwards until the backscatter is above one or both of the two detection thresholds.

B.3 Produce attenuated backscatter output message

- Range correct the backscatter to produce the attenuated backscatter.
- Attenuated backscatter (output), calibrated, range corrected but not tilt corrected.
- Smooth with a 20 m width running average.
- A noise gate can be applied based on a multiple of the 20 m detection threshold – this is customer configurable.
- Note the lower height range bins do not gate noise until the backscatter reaches zero. This allows the full extent of mixing layers to be viewed in gating mode.
Appendix C. **Cloud height calculation**

The scatter profile is inverted (using the Klett inversion technique) and an extinction profile is calculated.

Cloud base heights are identified using two criteria as follows (cloud is detected if either of them is met):

Criterion 1: likely cloud bases are estimated based on increasing slope of the extinction profile of at least 7 m per bin (bin width is 5 m) and an extinction threshold. This threshold is based on an extinction coefficient (EXCO) of 3, equivalent to a horizontal visibility (MOR) of 1,000 m. This results in a number of possible cloud bases at different heights.

Criterion 2: horizontal visibility falls below an average of 4,800 m over 300 m starting at an altitude of 1,000 m.

To report a cloud layer above a lower one the scatter coefficient first has to fall below the extinction threshold used for cloud definitions (less a small hysteresis offset). The scatter profile must then again meet the criteria above.

If rain is detected the sensitivity of detection is increased by a factor of 3.

To avoid many very narrow close layers being reported when they have little significance a minimum separation based on WMO reporting intervals is applied. The separation is +/- 30 m below 1,500 m and 300 m above 1,500 m. The lowest cloud height is used. If a thin cloud identified by Criterion 2 above is within +/-150 m of a cloud identified by criterion 1 then the thin cloud is ignored.
Appendix D. Sky condition algorithm description

The CS135 sky condition algorithm follows guidance from ICAO and WMO documents* and is based on 30 minutes of data. For this reason sky condition is not available for 30 minutes after power cycling the sensor, a reboot or changing measurement parameters. The sky condition algorithm is as follows:

Each measured hit comprising the lowest cloud height, (vertical visibility + onset of backscatter) / 2 and a weighting of 1 or 2 is stored in a running half hour buffer.

The weighting is 2 for hits in the last 10 minutes and 1 for hits in the previous 20 minutes.

If >50% of the hits in the latest 10 minutes are vertical visibility then the vertical visibility averaged over the last 10 minutes is reported. Only hits below the vertical visibility height limit set are used.

The buffer is sorted in height order and hits combined into bins with the following widths.

<table>
<thead>
<tr>
<th>Height</th>
<th>Bin width</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 5,000 ft</td>
<td>100 ft</td>
</tr>
<tr>
<td>5,000 – 15,000 ft</td>
<td>200 ft</td>
</tr>
<tr>
<td>15,000 ft – 33,000 ft</td>
<td>500 ft</td>
</tr>
</tbody>
</table>

For each bin a mean height is calculated by the following:

\[ \text{Hi} = \frac{\sum(h_i w_i)}{\sum(w_i)} \]

Where \( w_i \) is the weight (1 or 2) of the hit with height \( h_i \)

Bins are then reduced. A distance (D) between adjacent bins is calculated by the following equation:

\[ D = \frac{N_i N_j (H_i-H_j)^2}{N_i+N_j} \]

Where \( N_i \) and \( N_j \) are the sum of hits of each bin and \( H_i \) and \( H_j \) the respective heights.

Find the pair with the minimum distance D and combine into one bin with the height of the lowest and number of hits of the combined total.

This process is repeated until 5 or less bins remain. These are now taken as cloud layers.

Finally if cloud layers are closer than the distances below then they are merged with the height of the lowest and combined total number of hits.
Appendix D. Sky condition algorithm description

<table>
<thead>
<tr>
<th>Height range</th>
<th>Distance (D)</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

Weights per layer are used to calculate number of oktas per layer.

If the total possible is $W_{\text{max}}$ then the cover is $(W_i/W_{\text{max}}) \times 8$.

Cloud amounts are rounded up to the next highest whole oktas.

For layers above the lowest this is based on the maximum possible weights. If the lower layers have $W_1$ hits and the next layer has $W_2$ hits then the cover of the higher layer is given by:

$$(W_2/(W_{\text{max}}-W_1)) \times 8$$

For example, taking weighting into account, if lower layers of cloud only allow 4/8 of clear sky above and the cover is 2/8 out of those 4/8 then the layer above is taken as 4/8.

Finally only layers meeting the following criteria are reported:

Layer 1 $\geq 1/33$ oktas
Layer 2 $\geq 3$ oktas
Layer 3 $\geq 5$ oktas
Layer 4 $\geq 7$ oktas
Layer 5 $\geq 7$ oktas
Any layer $> (8 - 1/33)$ oktas is reported as 8 oktas
