

ExoMars - Going to Mars

Campbell Scientific contribution to ExoMars

On March 14, 2016 the European Space Agency (ESA) launched the first mission in the ExoMars Programme, intended to investigate the Martian Environment. This first mission includes the Trace Gas Orbiter, carrying instruments to detect and study atmospheric trace gases; plus a landing demonstrator module, known as Schiaparelli, carrying, among others, sensors to study the environment at the landing site.

The scientific payload on Schiaparelli includes the DREAMS (Dust characterisation, Risk assessment, and Environment Analyser on the Martian Surface) package. DREAMS is a small meteorological station that will measure local weather conditions at the landing site, such as temperature, humidity, pressure, dust opacity, wind speed and wind direction. It will also perform measurements of the electrical properties of the Martian

atmosphere, the first time this has ever been done.

The Principal Investigator for DREAMS is Francesca Esposito from INAF - Osservatorio Astronomico di Capodimonte, Naples, Italy. In order to study in detail the effect of electrical charging during dusty events – dust storms, dust devils, blowing sand and dust – Francesca's team performed several campaigns in the Western Sahara desert during 2013 and 2014. The measurement site was chosen for its similarity to Mars.

The Italian Space Agency (ASI) is the lead funding agency, with Raffaele Mugnuolo as the Programme Manager. The Italian Distributor for Campbell Scientific, Ecosearch, was invited to supply a series of monitoring instruments, similar to the DREAMS sensors. The installed systems, based on CR3000 and CR1000 dataloggers, collected various atmospheric and environmental data. The focus

Case Study Summary

Application:

Studying effect of electrical charging during dusty events.

Location:

Western Sahara

Contracting Agencies/Organizations Italian Space Agency (ASI)

Campbell Products Used:

CR3000 CR1000 CSAT3 WindSonic 1 CS110 CC5MPX.

Measured Parameters:

Air temperature Wind speed and direction Relative humidity Atmospheric pressure.

was on the processes responsible for lifting dust into the air and the relative feedback with the electrical properties of the atmosphere. The unique data collected from the sensors will help to interpret similar phenomena on Mars.

The masts shown here are 12 m, 4.5 m and 2.5 m in height, in contrast to the miniaturised versions (about 20.5 cm in height) that were developed for DREAMS.
