Overview

The AP200 is a complete, integrated CO\textsubscript{2} and H\textsubscript{2}O atmospheric profile system. It measures carbon dioxide (CO\textsubscript{2}) and water vapor (H\textsubscript{2}O) concentration from up to eight intakes, which are normally spaced along the height of a tower to give a vertical profile.

The AP200 is often used in conjunction with an eddy-covariance system to measure the storage term and give a more complete measure of the surface gas exchange.
